

SDL in a changing world

Edel Sherratt

Department of Computer Science
University of Wales Aberystwyth

Introduction

- ➔ Forces affecting SDL and other ITU-T notations

Introduction

- ➔ Forces affecting SDL and other ITU-T notations
 - ➔ new kinds of network

Introduction

- ➔ Forces affecting SDL and other ITU-T notations
 - ➔ new kinds of network
 - ➔ new kinds of service

Introduction

- ➔ Forces affecting SDL and other ITU-T notations
 - ➔ new kinds of network
 - ➔ new kinds of service
 - ➔ new developments in specification and modelling

Introduction

- ➔ Forces affecting SDL and other ITU-T notations
 - ➔ new kinds of network
 - ➔ new kinds of service
 - ➔ new developments in specification and modelling
- ➔ What this means for the ITU-T family of languages . . .

Introduction

- ➔ Forces affecting SDL and other ITU-T notations
 - ➔ new kinds of network
 - ➔ new kinds of service
 - ➔ new developments in specification and modelling
- ➔ What this means for the ITU-T family of languages . . .
- ➔ and the current SDL revision.

Influential trends

Influential trends

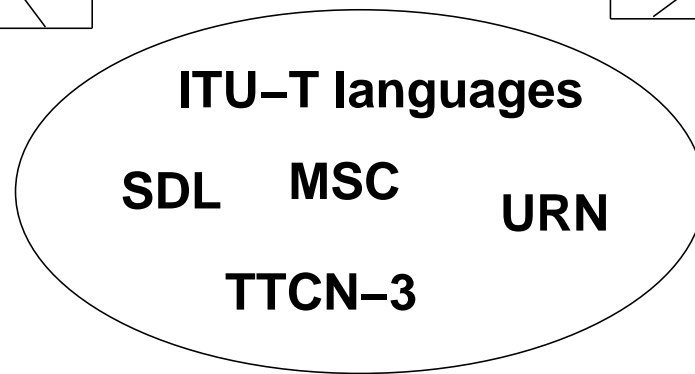

**Ubiquitous and pervasive
computing**

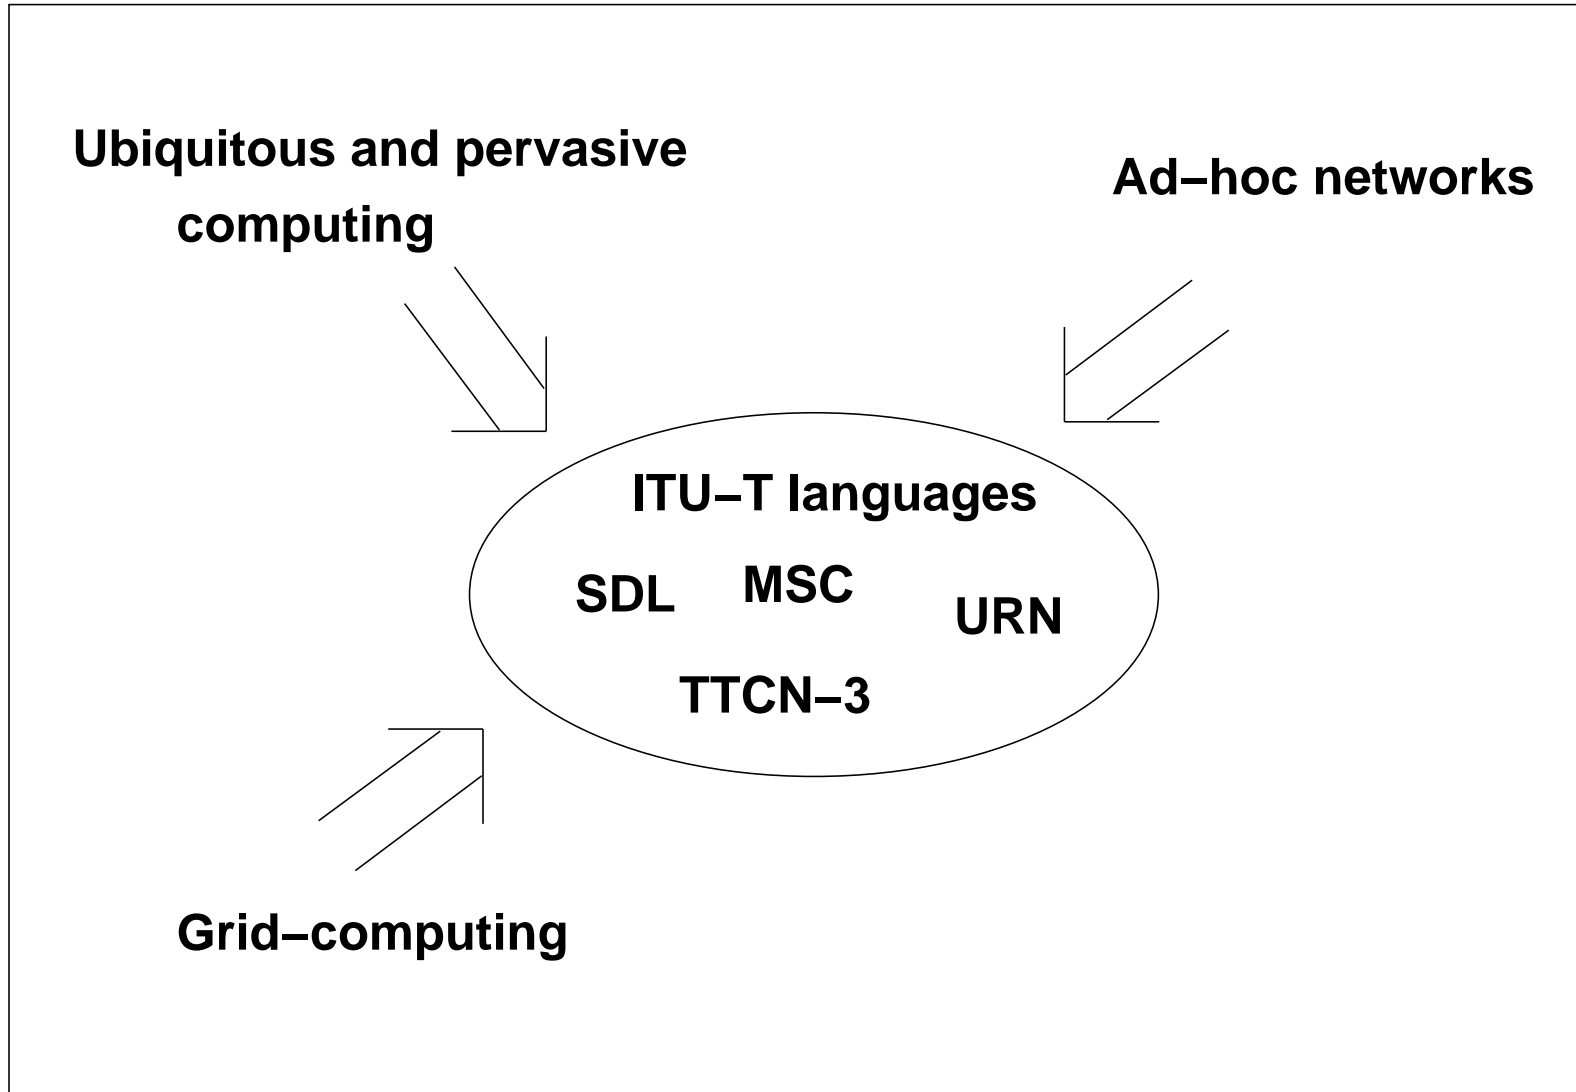

Influential trends

Ubiquitous and pervasive computing

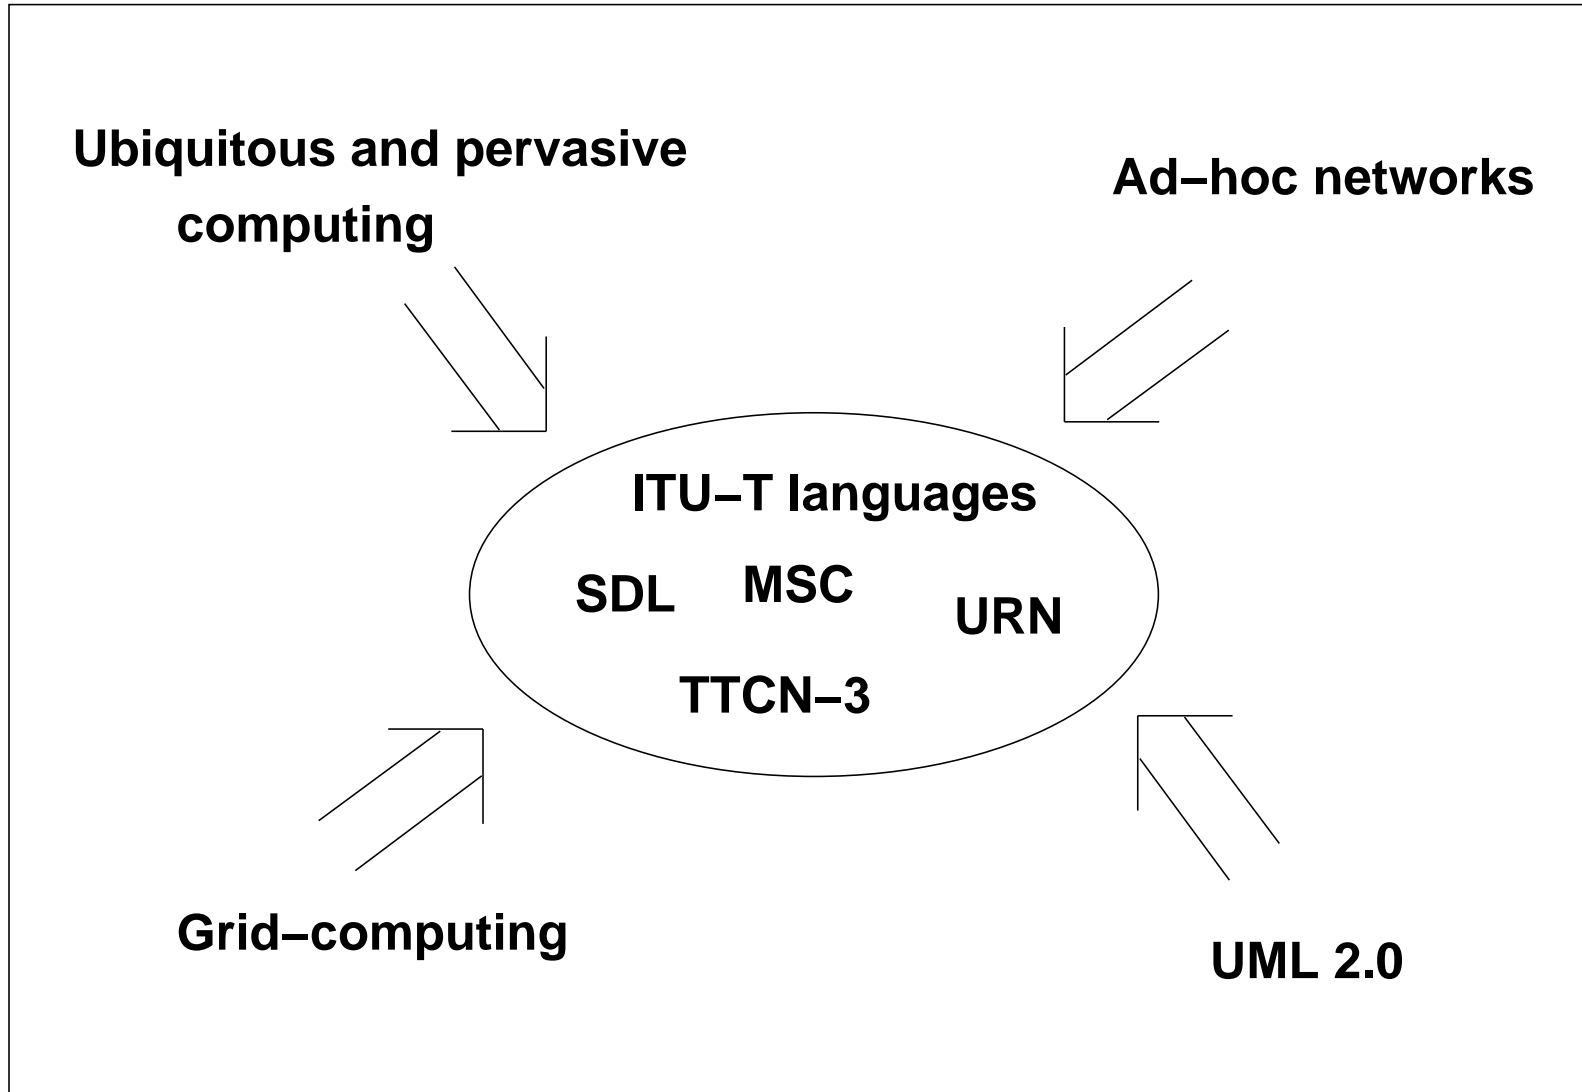

Ad-hoc networks

Influential trends

Influential trends

In the new world ...

- ➔ Nodes not subject to centralized control

In the new world ...

- ➔ Nodes not subject to centralized control
- ➔ Networks formed on an ad-hoc basis

In the new world ...

- ➔ Nodes not subject to centralized control
- ➔ Networks formed on an ad-hoc basis
- ➔ Use of standard, open, general-purpose protocols and interfaces expected

In the new world ...

- ➔ Nodes not subject to centralized control
- ➔ Networks formed on an ad-hoc basis
- ➔ Use of standard, open, general-purpose protocols and interfaces expected
- ➔ Many kinds of devices and interaction

In the new world ...

- ➔ Nodes not subject to centralized control
- ➔ Networks formed on an ad-hoc basis
- ➔ Use of standard, open, general-purpose protocols and interfaces expected
- ➔ Many kinds of devices and interaction
- ➔ Nontrivial quality of service requirements

Demands on models

- ➔ Active entities
- ➔ Exchange of signals and of data
- ➔ Dynamic (re)construction of communications infrastructure

Modelling Languages

- ➔ The ITU-T languages
- ➔ UML 2.0
- ➔ SDL and UML convergence

Dynamic Modelling with UML 2.0

- ➔ Activity diagrams – Petri net semantics
- ➔ Active classes and objects
- ➔ Behavioural state machines – object life cycle
- ➔ Protocol state machines – environment and interfaces
- ➔ Influences: ROOM, Harel state charts, OMT, SDL.

SDL-UML convergence

- ➔ UML 1.5 profile: recommendation Z.109
- ➔ IST project OMEGA profile
- ➔ Moda-Tel review
- ➔ ETSI Specialist Task Force 250

Extending UML 2.0

- ➔ Two kinds of extension:

Extending UML 2.0

- ➔ Two kinds of extension:
 - ➔ Collect stereotypes, tagged values and constraints into a profile
 - ➔ Lightweight extension
 - ➔ Restrictions ensure easy tool support

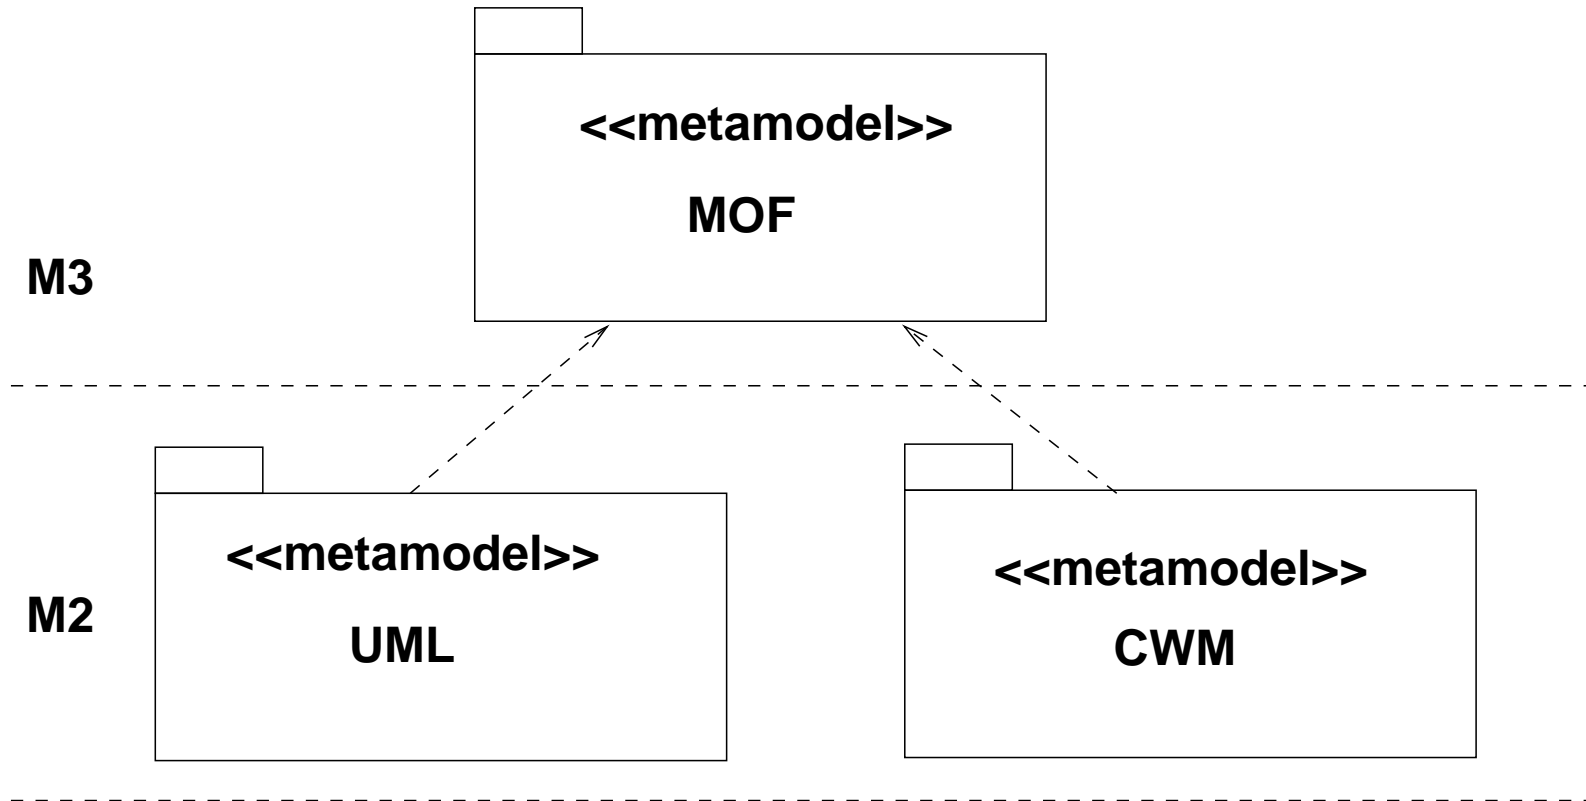

Extending UML 2.0

- ➔ Two kinds of extension:
 - Collect stereotypes, tagged values and constraints into a profile
 - Lightweight extension
 - Restrictions ensure easy tool support
 - Create a new language family based on the UML 2 infrastructure

Extending UML 2.0

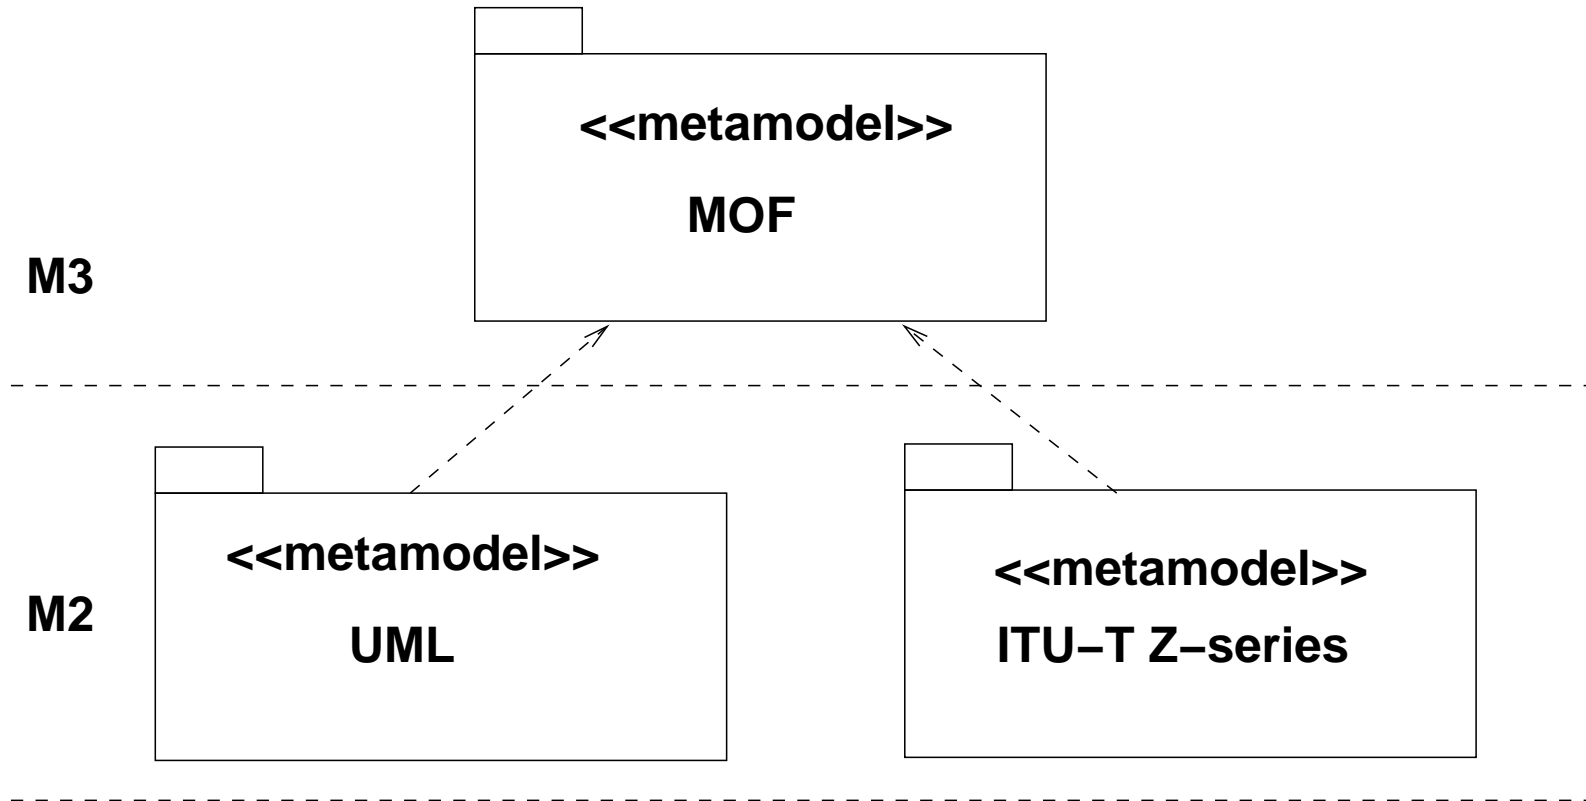

- ➔ Two kinds of extension:
 - ➔ Collect stereotypes, tagged values and constraints into a profile
 - ➔ Lightweight extension
 - ➔ Restrictions ensure easy tool support
 - ➔ Create a new language family based on the UML 2 infrastructure
- ➔ Relationship with MDA

Alternative Metamodels

UML 2.0 Infrastructure, p 26

Alternative Metamodels

Strengths of ITU-T languages

- ➔ Primary focus on communications domain
- ➔ Direct influence of ITU study groups

SDL: the current revision

- ➔ External influences
 - ➔ emergence and growth of new kinds of communications devices and networks
 - ➔ position of SDL with regard to UML 2.0

SDL: the current revision

- ➔ External influences
 - ➔ emergence and growth of new kinds of communications devices and networks
 - ➔ position of SDL with regard to UML 2.0
- ➔ Internal influences
 - ➔ economical disincentives and technical challenges that discouraged full support for SDL 2000
 - ➔ work of SDL task force in identifying the simplest useful subset of SDL

Specific Tasks

- ➔ Develop new exemplars for evaluating new revisions

Specific Tasks

- ➔ Develop new exemplars for evaluating new revisions
- ➔ Review output of ITU study groups, with particular attention to emerging areas

Specific Tasks

- ➔ Develop new exemplars for evaluating new revisions
- ➔ Review output of ITU study groups, with particular attention to emerging areas
- ➔ Evaluate relative merits of UML profile vs full-blown metamodel.

Specific Tasks

- ➔ Develop new exemplars for evaluating new revisions
- ➔ Review output of ITU study groups, with particular attention to emerging areas
- ➔ Evaluate relative merits of UML profile vs full-blown metamodel.
- ➔ Look into the possibility of defining an SDL core, like the UML core

Specific Tasks

- ➔ Develop new exemplars for evaluating new revisions
- ➔ Review output of ITU study groups, with particular attention to emerging areas
- ➔ Evaluate relative merits of UML profile vs full-blown metamodel.
- ➔ Look into the possibility of defining an SDL core, like the UML core
- ➔ Conduct market research with tool users and tool vendors

Conclusion

- ➔ SDL has proved equal to past challenges
- ➔ but – complacency is not appropriate
- ➔ The immediate future holds exciting challenges and opportunities
