# Introduction to Matlab

---

By: Mohammad Sadeghi

\*Dr. Sajid Gul Khawaja Slides has been used partially to prepare this presentation

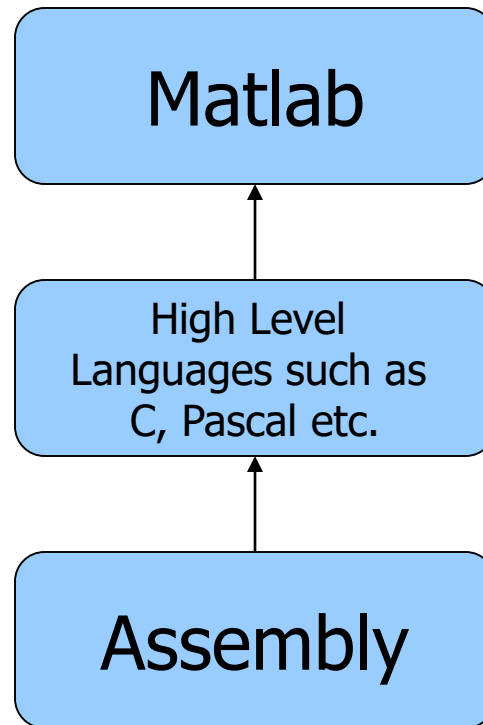

---

# Outline:

- What is Matlab?
  - Matlab Screen
  - Basic functions
  - Variables, matrix, indexing
  - Operators (Arithmetic, logical )
  - Basic Plotting
-

# What is Matlab?

- Matlab is basically a **high level language** which has many specialized toolboxes for making things easier for us
- How high?

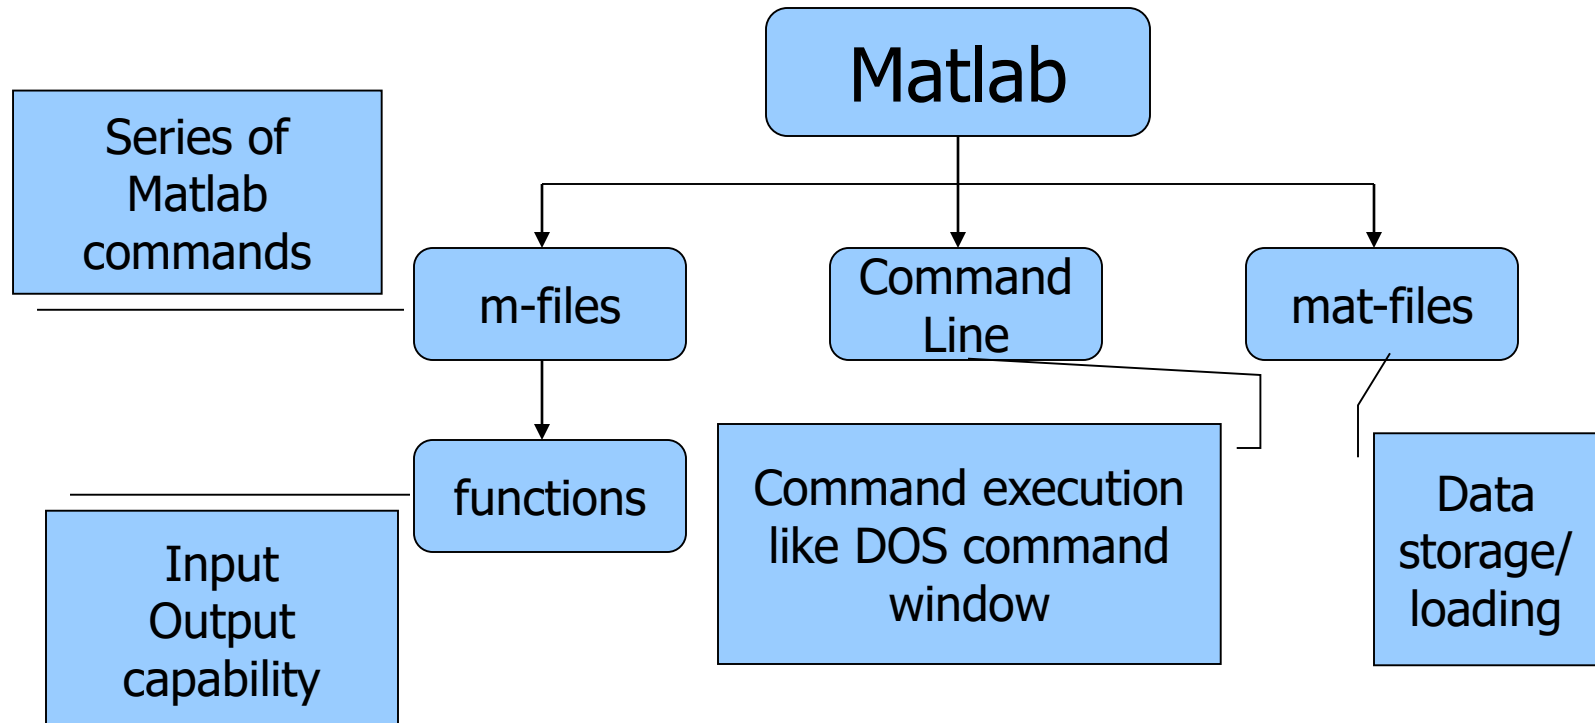

---

# What is Matlab?

- MatLab : **Matrix Laboratory**
- Numerical Computations with matrices
  - *Every number can be represented as matrix*
- Why Matlab?
  - User Friendly (GUI)
  - Easy to work with
  - Powerful tools for complex mathematics
- Matlab has extensive demo and tutorials to learn by yourself
  - Use help command

# What are we interested in?

- Matlab is too broad for our purposes in this course.
- The features we are going to require is

# Matlab Screen

## Command Window

- type commands

## Current Directory

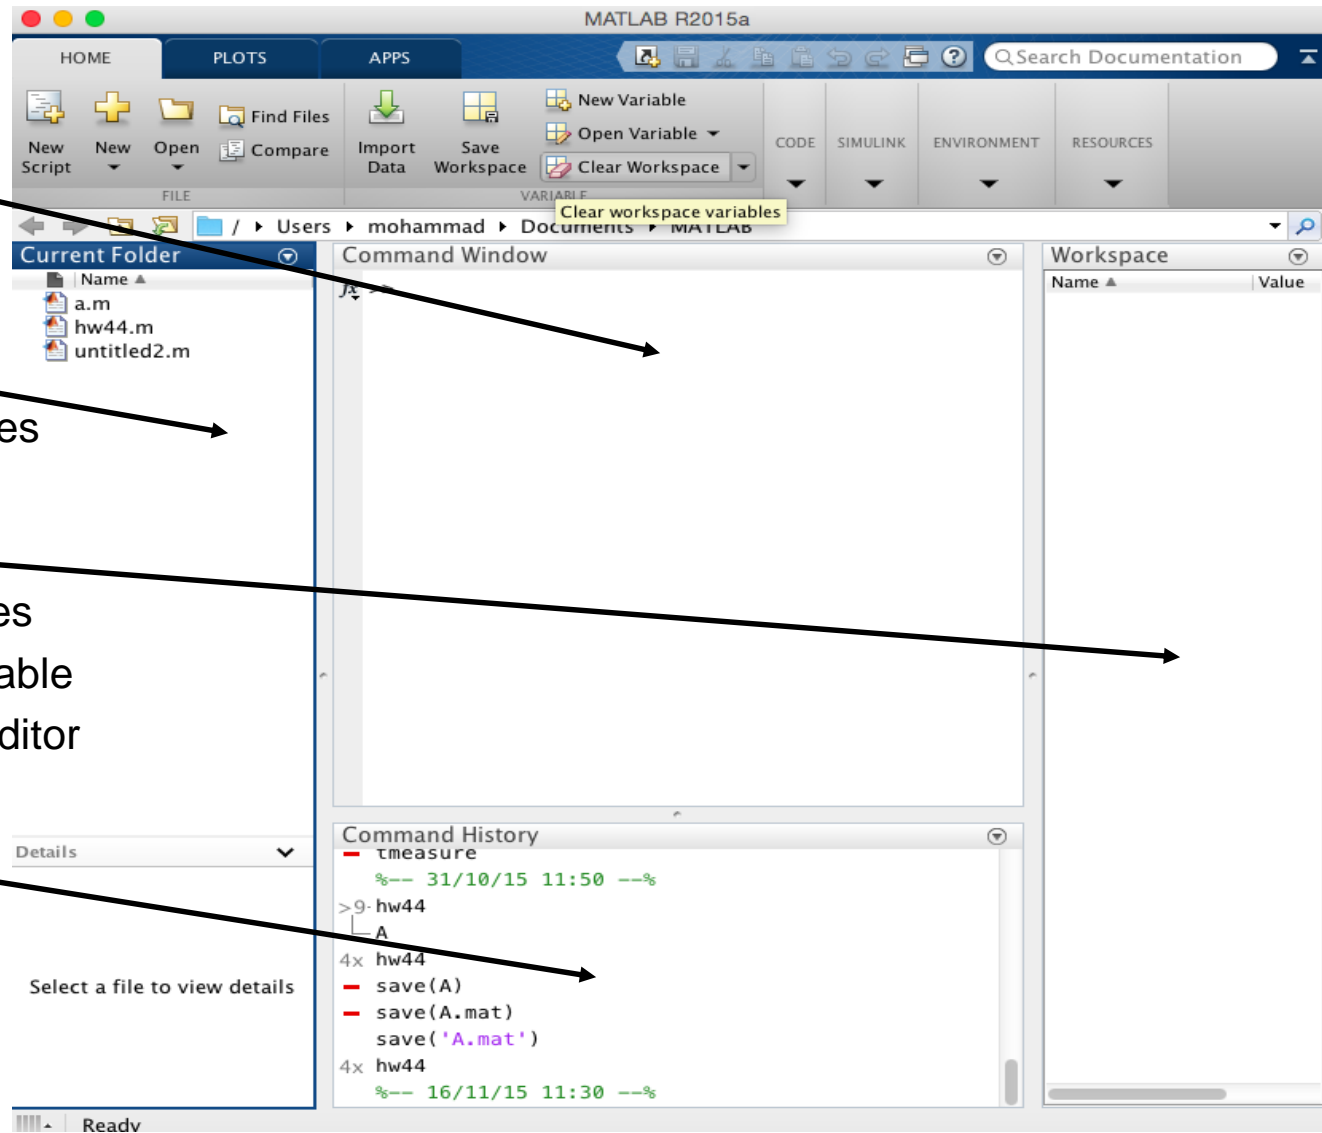

- View folders and m-files

## Workspace

- View program variables
- Double click on a variable to see it in the Array Editor

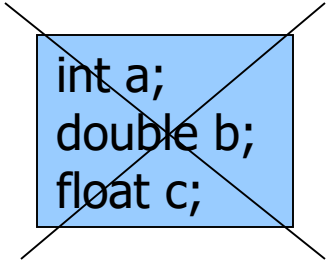

## Command History

- view past commands
- save a whole session using diary

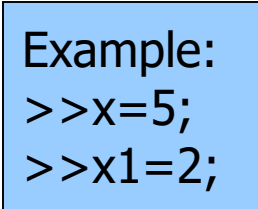

# Variables

- No need for types. i.e.,

```
int a;  
double b;  
float c;
```

- All variables are created with double precision unless specified and they are matrices.

```
Example:  
>>x=5;  
>>x1=2;
```

- After these statements, the variables are 1x1 matrices with double precision

---

# Variables (con't...)

- Special variables:
    - ans : default variable name for the result
    - pi:  $\pi = 3.1415926\dots$
    - eps:  $\epsilon = 2.2204e-016$ , smallest amount by which 2 numbers can differ.
    - Inf or inf :  $\infty$ , infinity
    - NaN or nan: not-a-number
-

---

# Elementary Math Function

- Abs(), sign()
  - $\text{Sign}(A) = A./\text{abs}(A)$
- Sin(), cos(), asin(), acos()
- Exp(), log(), log10()
- Ceil(), floor()
- Sqrt()
- Real(), imag()
- ^

# Array, Matrix

- a vector  $x = [1 \ 2 \ 5 \ 1]$

$x =$   
1    2    5    1

- a matrix  $x = [1 \ 2 \ 3; 5 \ 1 \ 4; 3 \ 2 \ -1]$

$x =$   
1        2        3  
5        1        4  
3        2        -1

- transpose  $y = x'$

$y =$   
1  
2  
5  
1

# Long Array, Matrix

■ `t = 1:10`

```
t =  
 1   2   3   4   5   6   7   8   9  10
```

■ `k = 2:-0.5:-1`

```
k =  
 2  1.5  1  0.5  0 -0.5 -1
```

■ `B = [1:4; 5:8]`

```
x =  
 1   2   3   4  
 5   6   7   8
```

# Vectors (con't...)

## Some useful commands:

<code>x = start:end</code>	create row vector x starting with start, counting by one, ending at end
<code>x = start:increment:end</code>	create row vector x starting with start, counting by increment, ending at or before end
<code>linspace(start,end,number)</code>	create row vector x starting with start, ending at end, having number elements
<code>length(x)</code>	returns the length of vector x
<code>y = x'</code>	transpose of vector x
<code>dot (x, y)</code>	returns the scalar dot product of the vector x and y.

---

# Vectors (con't...)

- Vector operation:
  - Max(), min(): max/min element of a vector
  - Mean(), median()
  - Std(), var(): standard deviation and variance
  - Sum(), prod(): sum/product of elements
  - Sort(): sort in ascending order

# Generating Vectors from functions

- `zeros(M,N)` MxN matrix of zeros

```
x = zeros(1,3)
```

```
x =
```

```
0      0      0
```

---

- `ones(M,N)` MxN matrix of ones

```
x = ones(1,3)
```

```
x =
```

```
1      1      1
```

---

- `rand(M,N)` MxN matrix of uniformly distributed random numbers on (0,1)

```
x = rand(1,3)
```

```
x =
```

```
0.9501  0.2311  0.6068
```

---

# Matrix Index

- The matrix indices begin from 1 (not 0 (as in C))
- The matrix indices must be positive integer

Given:

```
A =  
  
     3     5     3  
     6     8     2  
     2     7     3
```

```
>> A(6)  
  
ans =  
  
     7
```

```
>> A(3,2)  
  
ans =  
  
     7
```

```
>> A(2,:)   
  
ans =  
  
     6     8     2
```

```
>> A(1:2,2)  
  
ans =  
  
     5  
     8
```

A(-2), A(0)

**Error: ??? Subscript indices must either be real positive integers or logicals.**

A(4,2)

**Error: ??? Index exceeds matrix dimensions.**

A(:, 2)=[]

Delete second column

# Concatenation of Matrices

- $x = [1 \ 2], y = [4 \ 5], z = [0 \ 0]$

$$A = [x \ y]$$

$$\begin{matrix} 1 & 2 & 4 & 5 \end{matrix}$$

$$B = [x ; y]$$

$$\begin{matrix} 1 & 2 \\ 4 & 5 \end{matrix}$$

$$C = [x \ y ; z]$$

Error:

??? Error using ==> vertcat CAT arguments dimensions are not consistent.

# Operators (arithmetic)

+ addition

- subtraction

\* multiplication

/ division

^ power

‘ complex conjugate transpose

---

# Matrices Operations

Given A and B:

```
>> A = [1 2 3;4 5 6;7 8 9]
A =
     1     2     3
     4     5     6
     7     8     9
```

```
>> B = [3 5 2; 5 2 8; 3 6 9]
B =
     3     5     2
     5     2     8
     3     6     9
```

Addition

```
>> X = A + B
X =
     4     7     5
     9     7    14
    10    14    18
```

Subtraction

```
>> Y = A - B
Y =
    -2    -3     1
    -1     3    -2
     4     2     0
```

Product

```
>> Z = A * B
Z =
    22    27    45
    55    66   102
    88   105   159
```

Transpose

```
>> T = A'
T =
     1     4     7
     2     5     8
     3     6     9
```

# Matrices (con't...)

## more commands

Transpose	$B = A'$
Identity Matrix	$\text{eye}(n) \rightarrow$ returns an $n \times n$ identity matrix $\text{eye}(m,n) \rightarrow$ returns an $m \times n$ matrix with ones on the main diagonal and zeros elsewhere.
Addition and subtraction	$C = A + B$ $C = A - B$
Scalar Multiplication	$B = \alpha A$ , where $\alpha$ is a scalar.
Matrix Multiplication	$C = A * B$
Matrix Inverse	$B = \text{inv}(A)$ , $A$ must be a square matrix in this case. $\text{rank}(A) \rightarrow$ returns the rank of the matrix $A$ .
Matrix Powers	$B = A.^2 \rightarrow$ squares each element in the matrix $C = A * A \rightarrow$ computes $A * A$ , and $A$ must be a square matrix.
Determinant	$\text{det}(A)$ , and $A$ must be a square matrix.

$A, B, C$  are matrices, and  $m, n, \alpha$  are scalars.

---

# Operators (Element by Element)

- .\* element-by-element multiplication
  - ./ element-by-element division
  - .^ element-by-element power
-

# The use of “.” – “Element” Operation

```
A = [1 2 3; 5 1 4; 3 2 1]
```

```
A =
```

```
1 2 3

```

```
B = x*y
```

```
Error:
```

```
??? Error using ==> mtimes Inner matrix dimensions must agree.
```

# Solutions to Systems of Linear Equations

- Example: a system of 3 linear equations with 3 unknowns ( $x_1, x_2, x_3$ ):

$$3x_1 + 2x_2 - x_3 = 10$$

$$-x_1 + 3x_2 + 2x_3 = 5$$

$$x_1 - x_2 - x_3 = -1$$

Let :

$$A = \begin{bmatrix} 3 & 2 & 1 \\ -1 & 3 & 2 \\ 1 & -1 & -1 \end{bmatrix} \quad x = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \quad b = \begin{bmatrix} 10 \\ 5 \\ -1 \end{bmatrix}$$

Then, the system can be described as:

$$Ax = b$$

---

# Integral and derivative

- $\text{int}(-2*x/(1 + x^2)^2,x)$
  - $\text{int}(-2*x/(1 + x^2)^2,x,2,4)$
  
  - $\text{quad}(@ (x)x.^5.*\exp(-x).*\sin(x),2,4)$
  
  - $\text{Diff}(-2*x/(1 + x^2)^2,x)$
  - $\text{Diff}(-2*x/(1 + x^2)^2,x,2,4)$
-

---

# Solve equations

- `solve(@(x)sin(x)==1,x)`
  
  - `syms u v`
  - `[solv, solu] = solve([2*u^2 + v^2 == 0, u - v == 1], [v, u])`
-

# Solutions to Systems of Linear Equations (con't...)

## ■ Solution by Matrix Inverse:

$$Ax = b$$

$$A^{-1}Ax = A^{-1}b$$

$$x = A^{-1}b$$

## ■ MATLAB:

```
>> A = [ 3 2 -1; -1 3 2; 1 -1 -1];
```

```
>> b = [ 10; 5; -1];
```

```
>> x = inv(A)*b
```

```
x =
```

```
-2.0000
```

```
5.0000
```

```
-6.0000
```

Answer:

$$x_1 = -2, x_2 = 5, x_3 = -6$$

## • Solution by Matrix Division:

The solution to the equation

$$Ax = b$$

can be computed using **left division**.

## ■ MATLAB:

```
>> A = [ 3 2 -1; -1 3 2; 1 -1 -1];
```

```
>> b = [ 10; 5; -1];
```

```
>> x = A\b
```

```
x =
```

```
-2.0000
```

```
5.0000
```

```
-6.0000
```

Answer:

$$x_1 = -2, x_2 = 5, x_3 = -6$$

## NOTE:

left division:  $A \setminus b \rightarrow b \div A$

right division:  $x / y \rightarrow x \div y$

---

# Save/Load Data

- Save fname
  - Save all workspace data into fname.mat
  - Save fname x y z
  - Save(fname): when fname is a variable
- Load fname
  - Load(fname)

# Operators (relational, logical)

- == Equal to
- != Not equal to
- < Strictly smaller
- > Strictly greater
- <= Smaller than or equal to
- >= Greater than equal to
- & And operator
- | Or operator

# Basic Task: Plot the function $\sin(x)$ between $0 \leq x \leq 4\pi$

- Create an x-array of 100 samples between 0 and  $4\pi$ .

```
>>x=linspace(0,4*pi,100);
```

- Calculate  $\sin(\cdot)$  of the x-array

```
>>y=sin(x);
```

- Plot the y-array

```
>>plot(y)
```

Plot the function  $e^{-x/3}\sin(x)$  between

$0 \leq x \leq 4\pi$

- Create an x-array of 100 samples between 0 and  $4\pi$ .

```
>>x=linspace(0,4*pi,100);
```

- Calculate  $\sin(\cdot)$  of the x-array

```
>>y=sin(x);
```

- Calculate  $e^{-x/3}$  of the x-array

```
>>y1=exp(-x/3);
```

- Multiply the arrays y and y1

```
>>y2=y*y1;
```

Plot the function  $e^{-x/3}\sin(x)$  between  $0 \leq x \leq 4\pi$

- Multiply the arrays  $y$  and  $y1$  **correctly**

```
>>y2=y.*y1;
```

- Plot the  $y2$ -array

```
>>plot(y2)
```

# Display Facilities

## ■ plot(.)

Example:

```
>>x=linspace(0,4*pi,100);  
>>y=sin(x);  
>>plot(y)  
>>plot(x,y)
```

## ■ stem(.)

Example:

```
>>stem(y)  
>>stem(x,y)
```

# Plotting example

```
x = 0:pi/10:2*pi;  
y1 = sin(x);  
y2 = sin(x-0.25);  
y3 = sin(x-0.5);
```

```
plot(x,y1,'g',x,y2,'b--o',x,y3,'c*')
```

# Plotting example

```
x = 0:pi/10:2*pi;
```

```
y1 = sin(x);
```

```
plot(x,y1,'g')
```

```
hold on
```

```
y2 = sin(x-0.25);
```

```
Plot(x,y2,'b--o')
```

```
y3 = sin(x-0.5);
```

```
Plot(x,y3,'c*')
```

# subplot

```
subplot(3,1,1);  
plot(x,y1,'g')  
subplot(3,1,2);  
plot(x,y2,'b--o')  
subplot(3,1,3);  
plot(x,y3,'c*')
```

# Display Facilities

## ■ title(.)

```
>>title('This is the sinus function')
```

## ■ xlabel(.)

```
>>xlabel('x (secs)')
```

## ■ ylabel(.)

```
>>ylabel('sin(x)')
```

# semilogy

- `x = 0:0.1:10;`
- `y = exp(x);`
- `semilogy(x,y)`

# loglog

- $x = 0.01: 0.01:100;$
- $y = \exp(x);$
- $\text{loglog}(x,y)$

- `[X,Y] = meshgrid(-8:.5:8);`
- `R = sqrt(X.^2 + Y.^2) ;`
- `Z = sin(R)./R;`
- `mesh(Z)`

# The *for* Loop in MATLAB

- In MATLAB, a *for* loop begins with the statement indicating how many times the statements in the loop will be executed
- A counter is defined within this statement
- Examples:

```
for k = 1:100
```

(counter =  $k$ , the loop will be executed 100 times)

```
for i = 1:2:7
```

(counter =  $i$ , the counter will be incremented by a value of 2 each time until its value reaches 7. Therefore, the loop will be executed 4 times ( $i = 1, 3, 5, \text{ and } 7$ ))

# *for* Loop Example

```
1  for j = 1:10
2      x(j) = 5*j;
3  end
```

- The first time through the loop,  $j = 1$
- Because of the single value in parentheses,  $x$  will be a one-dimensional array
- $x(1)$  will be set equal to  $5*1 = 5$
- The second time through the loop,  $j = 2$
- $x(2)$  will be set equal to  $5*2 = 10$
- This will be repeated until  $j = 10$  and  $x(10) = 50$

---

# For loop exercises

- Find  $n!$  using matlab
- Find the  $1+2+3+\dots+100$  using matlab
- Find the  $3+6+9+\dots+99$  using matlab
- Make matrix of form

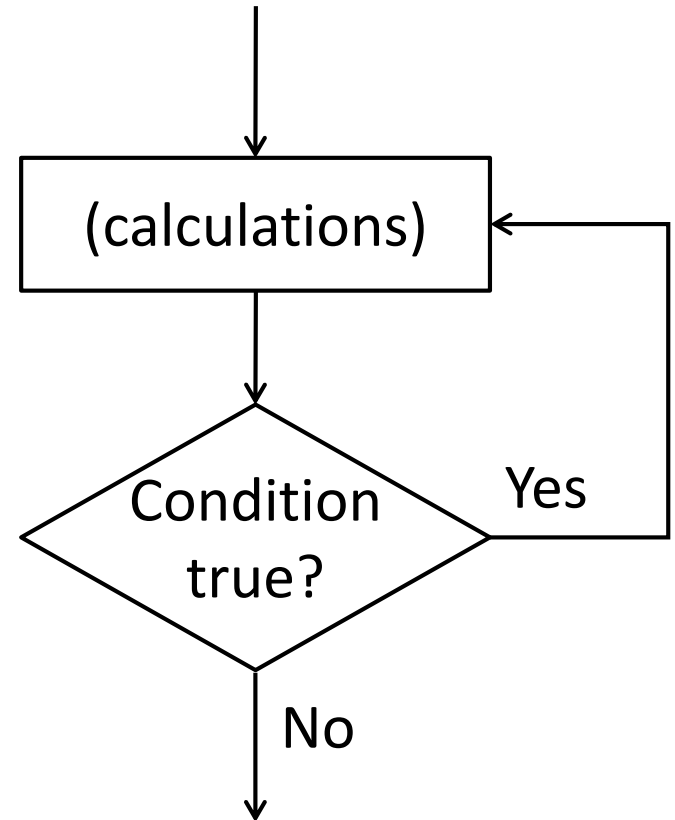

1	2	3	4	5	6
2	4	6	8	10	12
3	6	9	12	15	18
4	8	12	16	20	24
5	10	15	20	25	30
6	12	18	24	30	36

using for loop in matlab

---

# Flow Chart of *while* Loop

- The first line of this loop is:  
`while (condition)`
- Last line is:  
`end`

# Example

- Consider this loop:

```
k = 0;  
while k < 10  
    k = k + 2  
end
```

- How many times will the loop be executed?

Initially,  $k = 0$ , so the loop is entered

Pass #1:  $k = 2$ , so execution continues

Pass #2:  $k = 4$ , so execution continues

Pass #3:  $k = 6$ , so execution continues

Pass #4:  $k = 8$ , so execution continues

Pass #5,  $k = 10$ , so  $k$  is not less than 10 and execution ends

---

# Useful Commands

- The two commands used most by Matlab users are

```
>>help functionname
```

```
>>lookfor keyword
```

---

---

Thank You...

---
