RF Explorer®

Signal Generator

User Manual

Updated to Firmware Version 1.17 – 1.19

RF Explorer®

RF Explorer is an affordable Handheld Spectrum Analyzer and Signal Generator family of products with a growing list of features.

This little powerful unit is the tool you need

to reduce the implementation time and cost

of your next wireless project.

Table of Contents

Introduction

RF Explorer Signal Generator has been designed to be intuitive and easy to use. There is no need to read large user manuals to get advantage of its advanced functionality.

For simple actions, only a keyboard click is needed to start transmitting signals. For most advanced features like Tracking SNA, the RF Explorer for Windows software will easily guide through steps required so analyzing RF devices becomes a few minutes task for even the most novice users.

We welcome your feedback and look for ideas to make this manual more useful. Please contribute with ideas, suggestions, typo corrections and comments on the official discussion list

www.rf-explorer.com/forum

Description of main features

The RF Explorer Signal Generator is a powerful, wideband fully programmable RF signal generator. It is the perfect companion for Spectrum Analyzer RF Explorer product line.

As a standalone unit, RFE6Gen can generate CW and Sweep signals by selecting embedded menu options. When connected to a PC, it can be fully programmed with the RF Explorer for Windows software tool. Furthermore, the unit can work as a powerful Tracking Generator when used with RF Explorer Spectrum Analyzer connected to the same PC, offering full Scalar Network Analyzer (SNA) capabilities. The SNA feature allows full characterization of filters, amplifiers and any 2-port RF device.

Feature

- ✓ Pocket size and light weight

- ✓ Solid aluminum metal case

- ✓ Lifetime free firmware upgrades available, open to community requested features

- ✓ High capacity Lipo for 10hs+ of continuous run, rechargeable by USB

- ✓ RF Explorer for Windows PC client Open Source

- ✓ Can be extended with internal Expansion Modules for additional future band support and functionality

- ✓ Wide band support

Specification

- Frequency range supported: 23.4 to 6000 MHz

- Frequency step/resolution: 1KHz

- Frequency stability: 0.5ppm

- Temperature compensated (0-45C)

- Backlight for great indoor visibility

- Standard SMA 50 ohms connector

- Programmable Amplitude with included internal programmable attenuator:

    o -40dBm to -30dBm in 3dB steps

    o -10dBm to 0dBm in 3dB steps

- Amplitude accuracy: +-0.5dB (normalized) or +-3dB (absolute)

- Sweep measurement point speed < 10ms

- Graphics LCD 128x64 pixels, great visibility outdoors

- PC Windows client supports Windows XP/Vista/Win7 both 32 and 64bits

- Functional modes:

    o CW signal generator at any frequency in the range

    o Tracking generator functionality working together with RF Explorer when connected to the same PC.

    o Sweep generator between any to frequencies in the range, with selectable step size and speed

- Expansion:

    o Expansion port for future enhancements (higher RF power modes, additional frequency bands)

- Weight: 185g

- Size: 113x70x25 mm

www.rf-explorer.com/models

Connecting RF Explorer Signal Generator
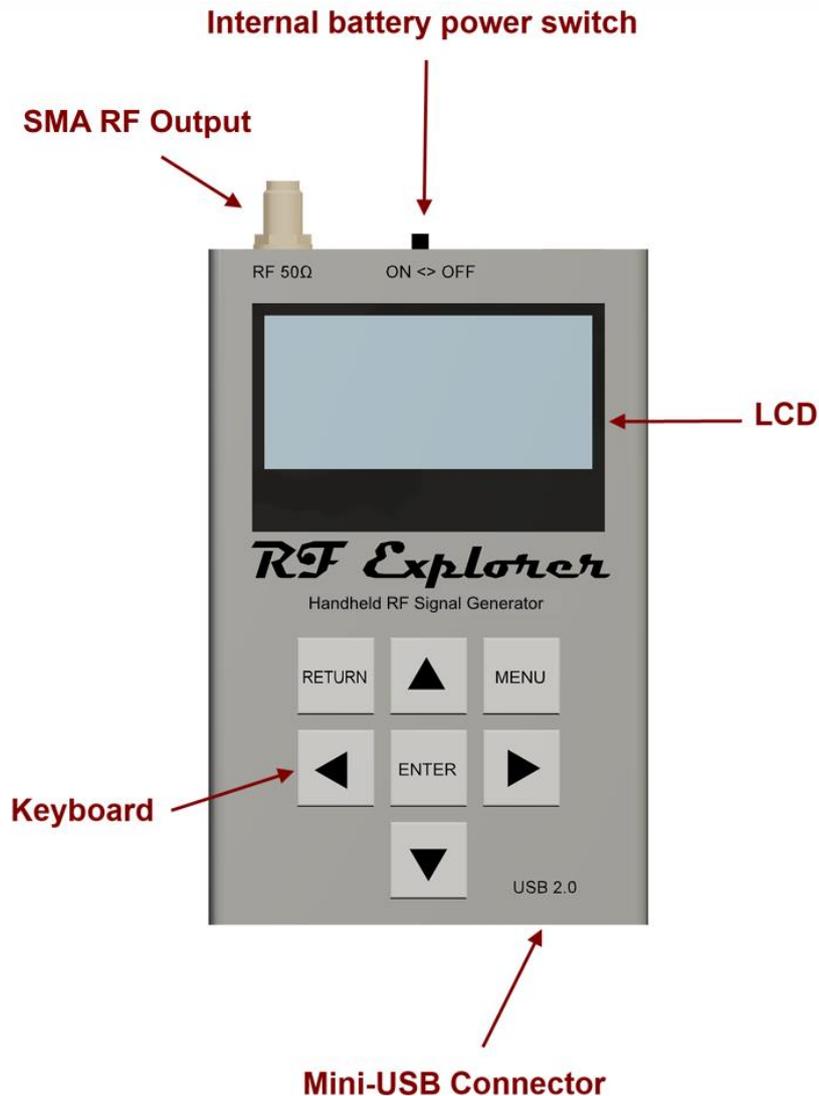

The unit includes 50 ohm impedance RF connector standard SMA format.

All models have a SMA left connector installed and, optionally, some future models may have a second SMA connector at the right position for extended range and functionality.

The unit will automatically start running on USB power when a compatible mini-USB cable is connected.

Important: The internal battery power switch must be in the ON position for the battery to charge when the USB cable is connected. The internal battery will not charge when the power switch is in the OFF position.

Note: There are a number of SMA adapters to easily interface RF Explorer SMA connector to any other standard RF connector format, including BNC, N, RP-SMA, etc. For more information of adapters available see section RF Explorer accessories in page 30.

Signal Generator CW mode - Main Screen

Upon start, RF Explorer Signal Generator goes to this mode automatically.

The RF output power is disabled by default and it is important to connect a LOAD in all cases before enabling the RF port.

The below screen is an example of a RF signal generator mode configured at 3.767020GHz. This is organized visually in GHz, MHz and KHz for easy reading.
The internal High Power switch to ON, and the power level in mode 2 (levels are 1-4). This result in (-3.1dBm) output at this frequency.

All elements on screen are important parameters to understand how the Signal Generator is working at any given time.

RF Signal Generator Main Screen
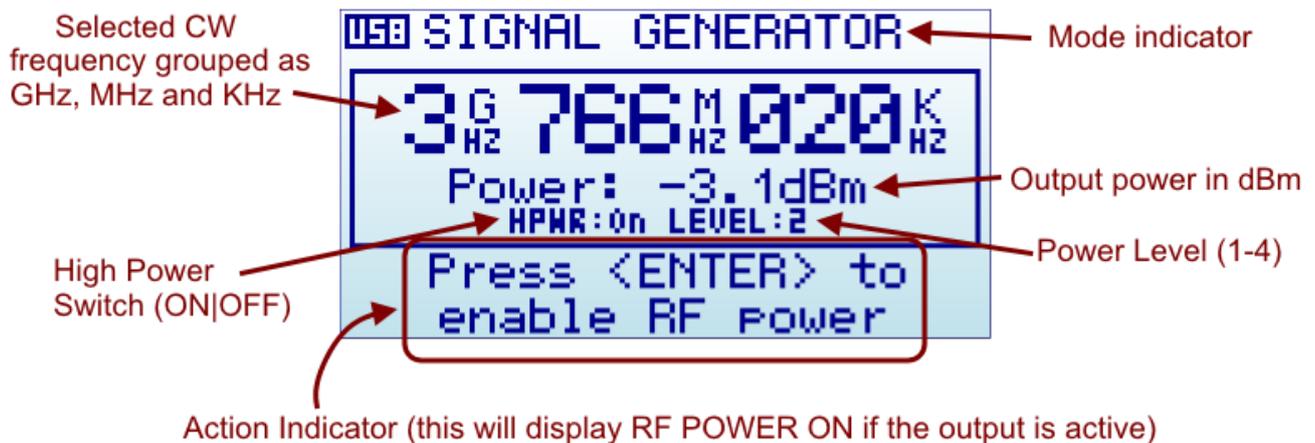

The available indicators are:

- **Selected CW frequency**: This is the currently selected carrier (or CW) frequency, expressed in GHz, MHz and KHz. It can be modified in the FREQUENCY MENU.

- **High Power Switch**: The Signal Generator includes an internal 30dB nominal attenuator. This allows the unit to generate low level signals for multiple purposes. The attenuator is disabled when the High Power Switch is ON.
- **Power Level Switch**: The Signal Generator includes an internal power switch, with a nominal 3dB increment on each step. There are a total of 4 steps. When combined with the internal attenuator, a total of 8 possible power values can be selected.
- **Power mode**: The Signal Generator describe the step required to enable the RF output signal, at the selected frequency and selected power level. By clicking on ENTER key the power signal will be delivered to the RF output port, and the screen will clearly indicate that with RF POWER ON message.

Please note standard precaution of RF power delivered without a connected load.

IMPORTANT

You must have connected a 50 ohm antenna or RF load before you switch your transmitter ON.

If you switch the transmitter ON without a proper load, you may damage the RF module of your RF Explorer Signal Generator, as the power amplifier will not have a load to feed. Think of the equivalent to an audio amplifier running at full power with no speakers connected: you are likely damaging the power transistors.

You can use any kind of RF 50 ohm load, including a dummy load, a coaxial with a 50 ohm termination, an antenna, etc. If you use a load different than 50 ohm, the reflected wave may also damage the power amplifier.

- **Using the keyboard**: In the RF SIGNAL GENERATOR mode screen, the keyboard can be used for easy and convenient tasks as described below:
    - Using buttons LEFT and RIGHT on this screen will increase or decrease the selected frequency by the amount expressed on the *Freq Step* value configured in the FREQUENCY MENU.

For instance, if the Freq Step is configured to 100MHz, clicking on RIGHT will increase the CW frequency in 100MHz increments everytime the key is pressed, and similarly clicking on LEFT button will decrease the CW frequency by 100MHz.

An example of increment from 3,766,020KHz using 1MHz increment step, RIGHT button click will increase to 3,767,020KHz and then LEFT button click will decrease it back to 3,766,020KHz:

o   Using buttons UP and DOWN on this screen will increase or decrease the selected RF power, one step at a time.

For instance if the unit is in *High Power:OFF* and *Level:1* (lowest possible power) a press on the UP button will increase into *High Power:OFF* and *Level:2*. Another press will increase to *Level:3*, etc.

The Level is sequentially increased up to the max level Level:4 and, if the High Power is OFF at that point, it will be set to ON to increase the power in the next increment with UP button. For instance if the unit is in *High Power:OFF* and *Level:4*, the press of UP button will increase to *High Power:ON* and *Level:1*. See RF power section *Understanding RF Power Modes* on page 18 for more details on power level modes.

o   Using ENTER key enables and disables RF output power

o   Using MENU key goes to the last used menu. Note: if the RF power was enabled, MENU will automatically disable it to avoid unattended power signal to be active. You can re-enable power once you get back from MENU configuration.

Using menus

There are several menus in RF Explorer Signal Generator. They are organized on different screens, which you can iterate through by using the [Menu] key. If you click [Menu] button multiple times, you will visit every one of them:
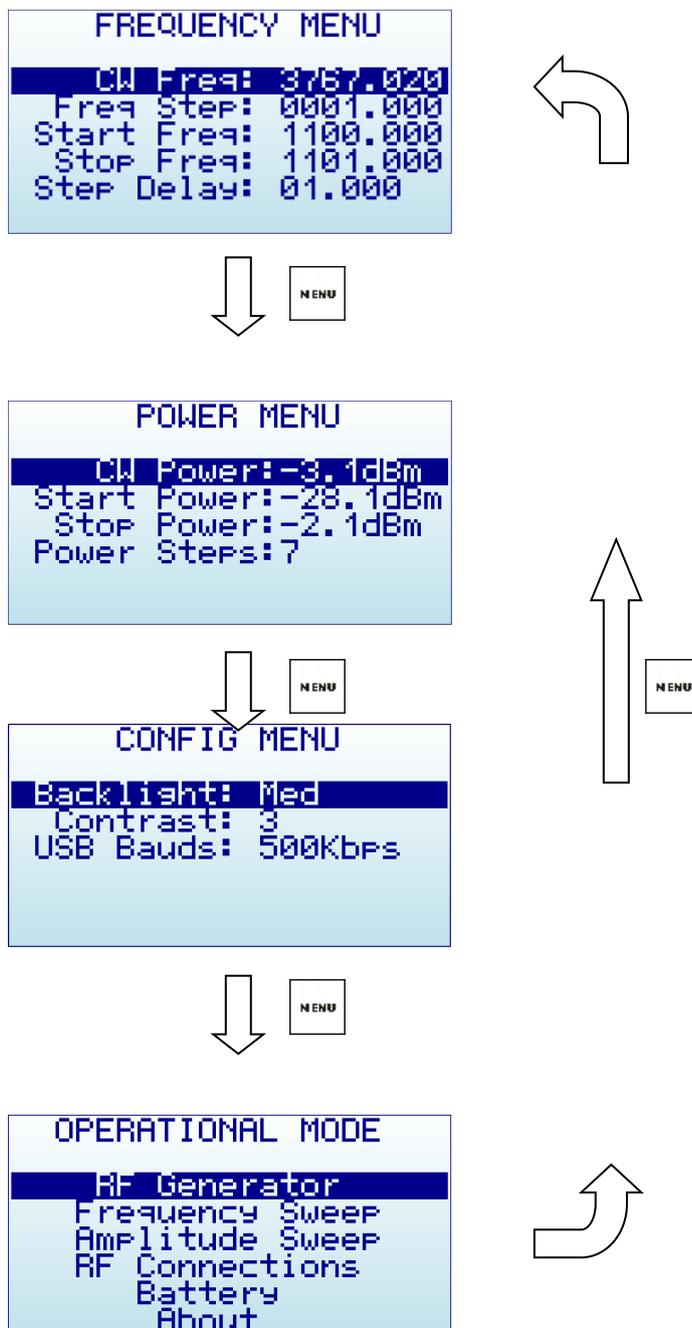

Optionally, you can use the [Left] and [Right] keys to go from one screen to another.

You can exit from a menu anytime by using the [Return] key.

The first time you click on [Menu] button in a RF Explorer session, Frequency Menu will open. This may change as we will see later, so every time you click on [Menu] from Signal Generator main screen, you actually re-open the last menu you were working with. In this way you save time by not having to navigate through all the menus to go the same place you were before.

Operational Mode menu

The menu display different functional modes available in your Analyzer.

```
OPERATIONAL MODE

     RF Generator
   Frequency Sweep
   Amplitude Sweep
    RF Connections
       Battery
        About
```

Use [Up] and [Down] arrow keys to select the desired mode and click on [Enter] to activate it immediately.

- **RF Generator** mode is the default mode, this is used for carrier CW signals

- **Frequency Sweep** allows iterative hops over Start Frequency and Stop Frequency defined by a Step Frequency and a Step delay.

- **Amplitude Sweep** allows iterative amplitude change at CW frequency.

- **RF Connections** enumerates the installed RF modules and how each one is connected to each SMA RF port. This example below shows a standard RFE6GEN model with 24 to 6000MHz. Click on any key to get out of this screen.

```
*
 └───────┤24-6000MHZ│

    Easily enhance your
      RF Explorer with
   Expansion Modules to
   cover extra RF bands
    www.RF-EXPLORER.com
```
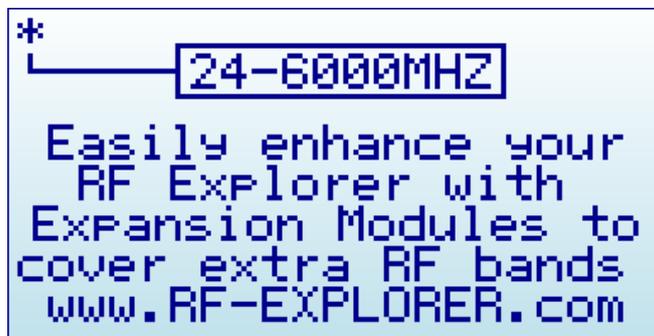

- **Battery** includes details on internal battery charge level, and assist you on charging the unit when connected to USB. For more details read section *Charging the internal battery* in page 23.

- **About** displays information about installed firmware and versioning. Use any key to get out of this screen.

Frequency Menu

```
    FREQUENCY MENU

 CW Freq:  3767.020
 Freq Step:  0005.000
Start Freq:  1100.000
 Stop Freq:  1200.000
Step Delay:  01.000
```
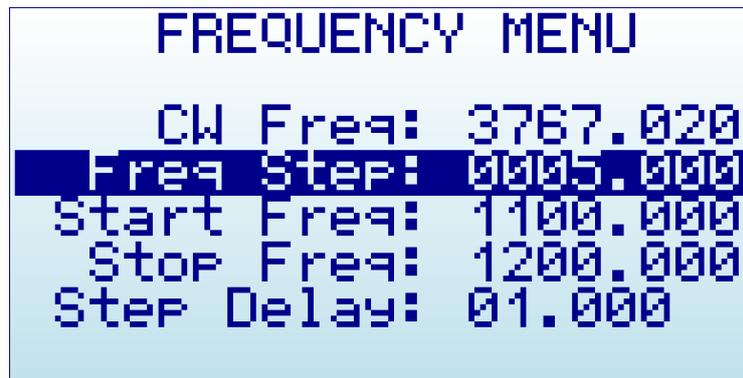

- **CW Freq**: CW frequency selected for transmission in MHZ
- **Freq Step**: Frequency step in MHZ used in Frequency Sweep mode and when using LEFT-RIGHT button increments in CW mode.
- **Start Freq**: Lower frequency in MHZ used in Frequency Sweep mode
- **Stop Freq**: Higher frequency in MHZ used in Frequency Sweep mode
- **Step Delay**: Selected step delay for Amplitude / Frequency Sweep in seconds (with millisecond resolution)

To navigate through the menu, just use [Up] and [Down] keys to go to the option you want, then click on [Enter] to edit that option, [Left] or [Right] to go to the digit you want to change, and [Enter] to confirm or [Return] to cancel.

In above example screen:

- CW frequency is 3,767.020 MHz
- Frequency sweep will run from 1,100.000 MHz to 1,200.000 MHz with a 5 MHz step and 1 second delay

Power Menu

```
    POWER MENU

    CW Power:-3.1dBm
 Start Power:-28.1dBm
  Stop Power:-2.1dBm
 Power Steps:7
```
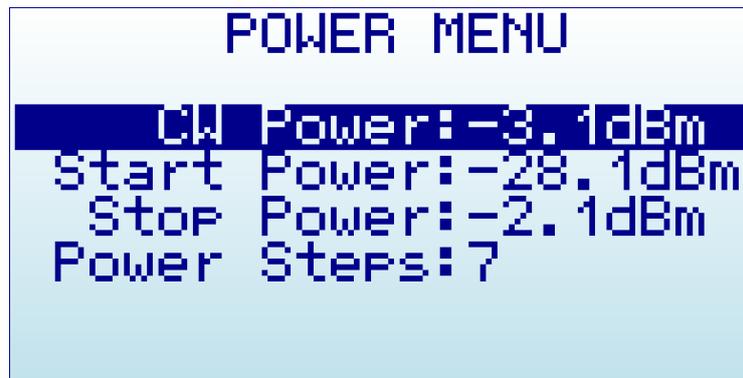

- **CW Power**: Power level used for Generator CW mode and Frequency Sweep mode.
- **Start Power**: Lower power level for Amplitude Sweep
- **Stop Power**: Higher power level for Amplitude Sweep
- **Power Steps**: number of steps used in Amplitude Sweep, automatically calculated based on Start/Stop power settings.

To navigate through the menu, just use [Up] and [Down] keys to go to the option you want, then click on [Enter] as many times as required to change the power value. The Power Steps setting is not editable (automatically calculated).

Understanding RF Power Modes

The RF Explorer Signal Generator delivers 8 different power levels, nominally specified as per table below:

RF output power (nominal)	High Power	Power Switch
0dBm (1mW)	ON	4
-3dBm (0.5mW)	ON	3
-6dBm (0.25mW)	ON	2
-9dBm (0.125mW)	ON	1
-30dBm (1uW)	OFF	4
-33dBm (0.5uW)	OFF	3
-36dBm (0.25uW)	OFF	2
-39dBm (0.125uW)	OFF	1

These are ideal power levels that are not actually constant with frequency. Actual power levels are a function of frequency, as depicted in graph below. This graph is generic but every RF Explorer Signal Generator includes an internal calibration table, produced in the factory at calibration time, with actual values for accurate reading on screen.

RF Explorer Signal Generator RFE6GEN output power typical response
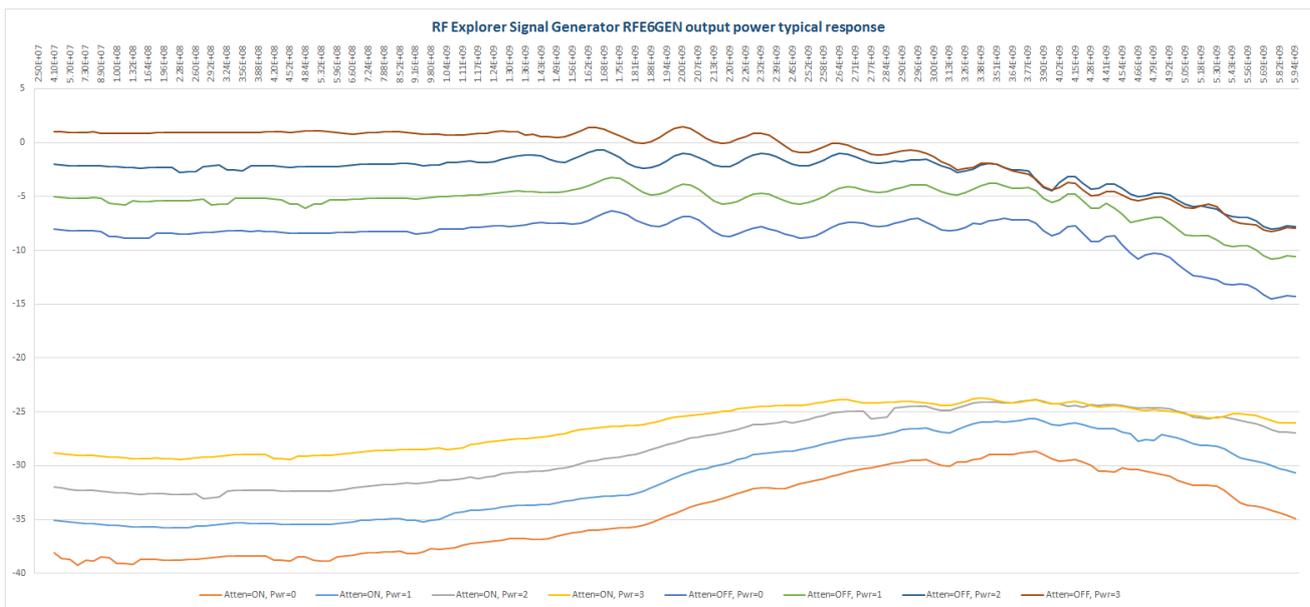

The delivered power levels have a linear response up to about 2GHz, for higher frequencies there are some roll off and power becomes predictable but not constant. The unit is fully calibrated and includes an internal amplitude calibration table to allow accurate power normalization and measurement done in Tracking mode.

The exact power level available on each frequency point is available on screen, as well as in the RF Explorer for Windows application. If you need more details or power level accuracy is important to you, please contact us.

A future Hardware module upgrade, available for connection on the internal expansion port, will allow for additional power modes with finer granularity, higher power values and flat frequency response as an option.

Configuration Menu
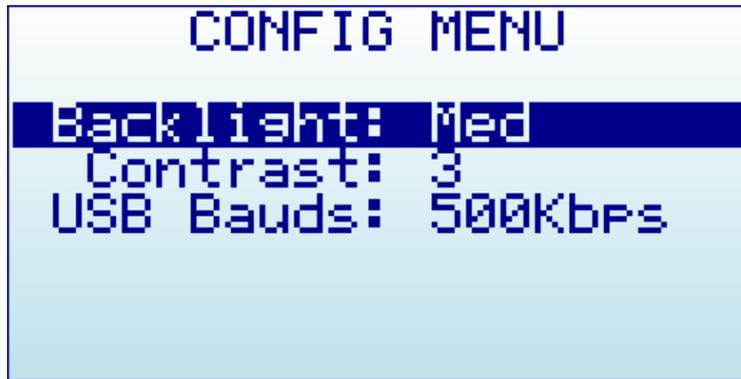

- **Backlight**: Several levels of display backlight. RF Explorer has good visibility indoor and outdoor, including direct sunlight. The level of backlight should be the appropriate for each condition, and you may want to limit backlight brightness to preserve battery capacity.
- **Contrast**: There are 10 different display contrast levels to choose from.
- **USB Bauds**: Default is 500Kbps, which is also the recommended setting. In the rare case you experience a problem when connecting with the PC, you may want to change this to 2400bps slower speed. However, this is not recommended as the connection will go really slow, so do this only if there is a good reason to. The port speed in the RF Explorer and PC Client settings must match to properly establish a connection.

Frequency Sweep mode
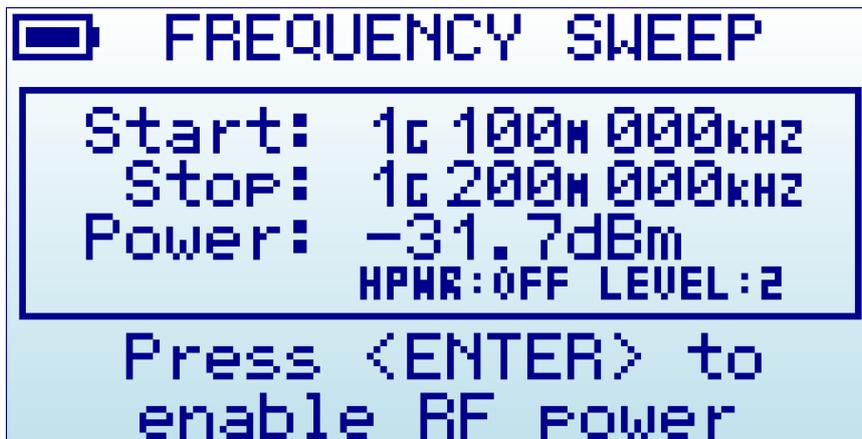

The RF Explorer Signal Generator Frequency Sweep mode allows iterative hops over Start Frequency and Stop Frequency defined by a Step Frequency and a Step delay.

To start the Frequency Sweep, press ENTER key. The Sweep will be active until ENTER is pressed again.
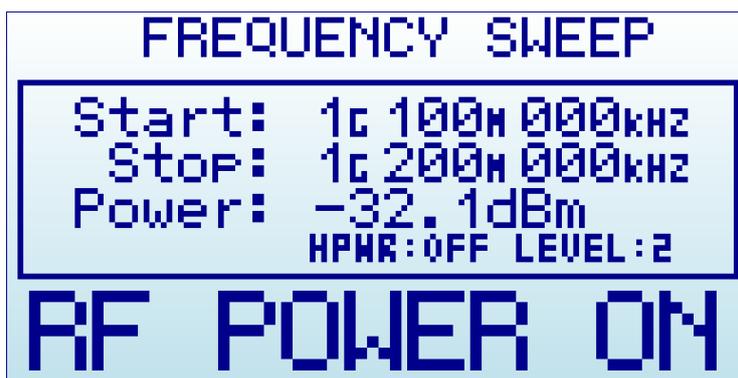

In above example, Frequency Start is 1,100.000MHz and Frequency Stop is 1,200.000MHz. The nominal power level is -31.7dBm with *High Power:OFF* and *Level:2*. Using UP and DOWN button will change power level one step at a time.

The Frequency Step and Step delay used for the sweep is defined in the FREQUENCY MENU.

FM modulation

RF Explorer Signal Generator RFE6GEN does not directly create FM or AM modulation signals, but can be easily used to produce low rate modulation including SINAD signals using Frequency Sweep.

For a FM modulation of 1 KHz tone typically used for SINAD, proceed as follows:

- Select the Start Frequency the value you need (e.g. 2.000000GHz)
- Select the Stop Frequency the FM deviation you need. For instance for a 5KHz deviation, set exactly 5KHz above (e.g. 2.000005Ghz)
- Select the Frequency Step same value as FM deviation (e.g. 5KHz)
- Select the Step Delay. For a 1KHz tone, you need 1ms delay, therefore define Step Delay:00.001
- Select RF power you need and start transmission using Frequency Sweep operational mode.

With this technique the highest rate tone generated is 1 KHz (which correspond to 1ms step delay). With a 2ms step delay, frequency tone is 500Hz, etc.

Amplitude Sweep Mode
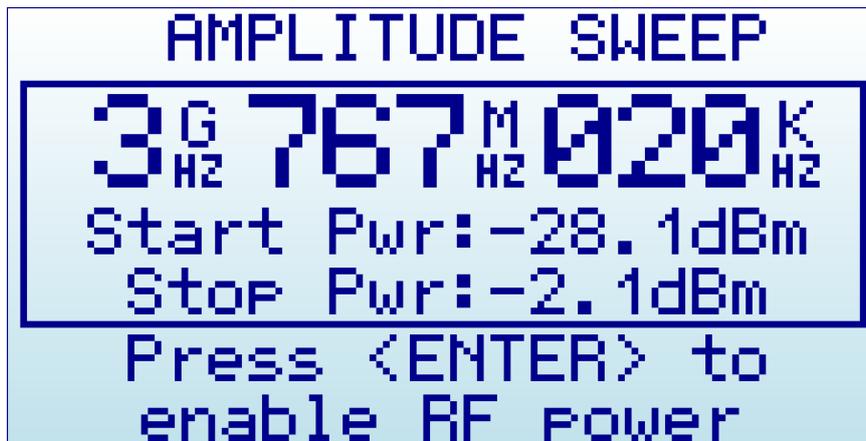

The RF Explorer Signal Generator Amplitude Sweep allows iterative amplitude change at CW frequency using Step delay.

To start the Amplitude Sweep, press ENTER key. The Sweep will be active until ENTER is pressed again.
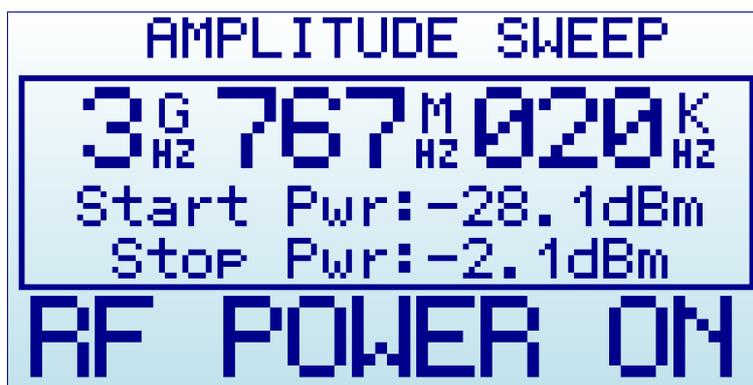

Using LEFT and RIGHT buttons the frequency can be decremented/incremented manually, as well as using the Frequency Menu where Step Delay is also configurable.

In above example, amplitude will sweep from -28.1dBm to -2.1dBm at 3,767,020KHz. The amplitude steps used for the sweep is determined for the many power levels between Start/Stop levels, in this case 7 steps total. The number of power levels are displayed in the POWER MENU.

RF Explorer internal battery

The internal battery is a high capacity Lithium-ion polymer 1000mAh. This is the same battery technology used in cell phones and modern laptops and tablet computers.

The power switch is a *true hard switch* connecting the battery in ON position, fully isolating the battery in the OFF position. As the battery is fully disconnected in the OFF position, you can keep your RF Explorer stored for months and the battery will keep the charge intact, as opposed to cell phones or laptops which typically implement a *soft switch* which slowly discharge the battery by drawing a microamperes continuously from it. This doesn't happen in your RF Explorer.

We designed RF Explorer power circuitry in a way you can always have your RF Explorer ready to use!

Note there is actually a self-discharge effect in the battery but it is so negligible that you can store your device for a year or more and a battery will not be depleted.

<div style="background:yellow">

<u>IMPORTANT</u>

Never charge your device unattended or in any place where there is a risk of fire.

Never store RF Explorer in a place where temperature may go beyond 50ºC (122F). A car can heat up incredibly quickly in the *sun*, especially in the summer, and damage or reduce the lifetime of your battery if stored in such an environment.

If you manipulate RF Explorer to assemble an Expansion Module, always proceed very carefully with the Lithium Ion battery and make sure it is not punctured, damaged or inflated in any way. A healthy battery is a flat rectangle with no signs of any deformation. If you have any doubt, please take a picture of your unit and send it to us for further help.

If your battery doesn't seem to hold a charge or work properly, or if the unit gets hot when charging, switch the power button OFF immediately and review and/or replace your battery.

Never use RF Explorer with a damaged battery or with a Lithium Ion battery different than the one officially supplied by technical service, which includes a protection circuit for safety. Contact QC@SeeedStudio.com if you have any question on any matter related with your battery or if you need a replacement.

</div>

Charging the internal battery

To charge the internal battery, plug it in to a powered USB port or USB wall-wart charger via the USB mini socket. For the internal charger to access the battery, you must set the power switch to ON position, otherwise the device will be running from USB but will not use or charge the internal battery.

RF Explorer may draw up to 500mA according to USB standard, and may take up to 3hs max to charge a fully discharged battery in normal conditions. We recommend the first time to be charged for up to 8hs.

It is ok having the battery connected forever to the USB port, the internal charger will stop and start the charge when needed.

If your USB port is unpowered it may not be capable of delivering more than 100mA; the battery may not be charged at all. If you have no other option available than a 100mA USB port, set the LCD backlight to OFF in the OPTIONS MENU and keep charging for as long as needed (it may take up to 24hs in these conditions so you should use a powered USB port whenever possible).

Using the Battery dedicated screen

In latest firmware versions, you can use the specific Battery menu option for better battery charge control. Note: As long as the USB is connected and the power switch is in the ON position, the battery will charge. However, you can get additional information when using the Battery specific menu.

Inside this INTERNAL BATTERY charger screen, it is easier to realize if the battery is being charged. In this case below, it clearly indicates the power switch is not in the ON position and, therefore, battery is not being charged.
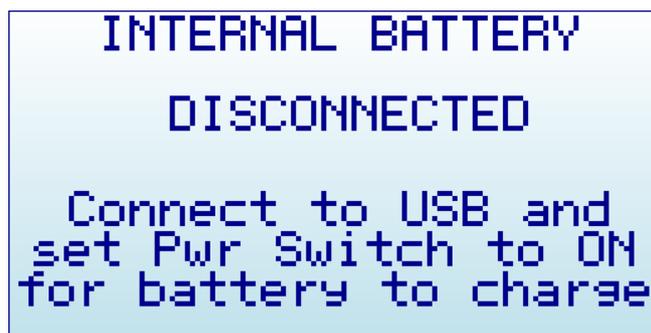

As soon as the power switch is set to the correct position, the screen will display correct charging status.

```
INTERNAL BATTERY
BATTERY LEVEL:73%
CHARGING
```

At this point you can close this screen pressing ENTER or RETURN. If you keep it active for more than 15 seconds, it automatically sets the device in SLEEP MODE - all internal circuits and LCD backlight go off, except for charging and minimal CPU monitoring - This is the recommended procedure to charge the device overnight. Note: for the sake of clarity, below black/white screen images are depicted when LCD backlight is OFF.

```
INTERNAL BATTERY
BATTERY LEVEL:99%
CHARGING
SLEEP MODE
```
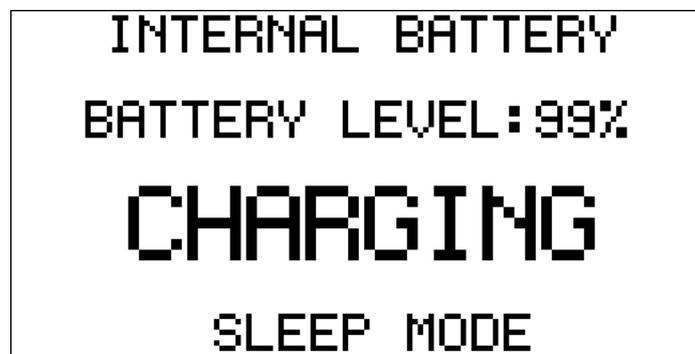

In this mode you can stop charging whenever the device reaches 99% or 100%, which may take up to 2 or 3 hours under normal condition and depending on initial battery charge level. When the charging algorithm detects the battery fully charged and a minimum of 2hs connected, it will suggest disconnecting the USB cable.

```
INTERNAL BATTERY
BATTERY LEVEL:99%
DISCONNECT USB

SLEEP MODE
```
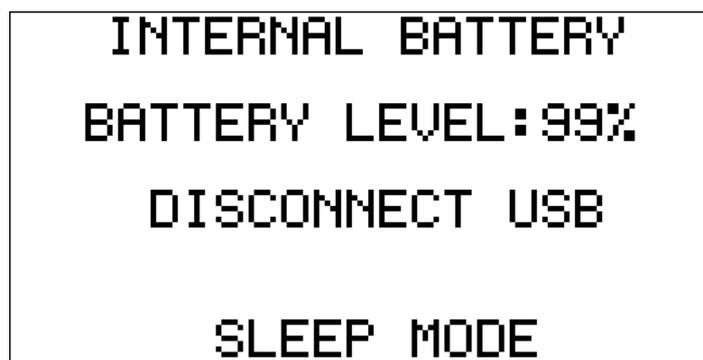

Calibrating the battery capacity

The INTERNAL BATTERY screen, at this point, can re-calibrate the available battery power level. This is a useful feature to adjust what reference voltage the internal charger considers 100% capacity. This reference is subject to change over time as the internal battery reduces total capacity over many charge cycles. As a reference, 500 charge cycles will typically reduce the total battery capacity about 30% - in order for this new

capacity to be consistent with the battery icon on screen, you can easily recalibrate after the charge process completed.

In the previous example screen, if the battery charge remains at 99% (or any other level) after the internal charger timer completes 3hs charge process, it will keep asking to DISCONNECT USB.

By doing so, the firmware adjust for a few seconds the new charge level and save in internal ROM for future use.

```
┌─────────────────────────────┐
│     INTERNAL BATTERY        │
│                             │
│    CALIBRATING              │
│                             │
│      SLEEP MODE             │
└─────────────────────────────┘
```

After the device recalibrates the internal battery charge reference level, it will automatically restart and you should see the Battery icon (on Spectrum Analyzer screen) showing full charge.

Charging a fully depleted battery

The firmware includes a protection mechanism to shutdown everything if the battery goes too low, in the range of 3.3V or less. However, this state will still keep drawing about 1mA from the battery. If you keep the power switch to ON forever the battery will be depleted but limited to a safe 3V level where battery protection circuitry will reduce the leakage to about 50uA.

In any case, the internal battery charger will take care of the battery conditions once it gets powered back from the USB and will charge the battery using an internal efficient algorithm. For that to work properly when the battery was fully depleted, you should use the Battery menu option as described.

Automatic idle mode with battery charge

As described in previous section, you should enable the Battery screen and keep it charging for the device to automatically set internal circuits to Sleep for overnight charge.

Note: A more limited, equivalent functionality was available in old firmware versions prior to v1.16 in the About screen, it has now moved to the new Battery screen. The About screen no longer sets the device to sleep.

Expansion Modules

RF Explorer Signal Generator includes an internal expansion port to enhance the RF power capabilities and frequency coverage of the main unit with RF Explorer Signal Generator compatible Expansion Modules. Note: Spectrum Analyzer modules cannot be connected to the Signal Generator, they are incompatibles and have a changed gender connector to avoid any change of connecting incompatible modules.

Currently under development, to learn more about different expansion options available in the future, please visit

www.rf-explorer.com/models

Protecting your instrument from damage

Please protect the RF port from static discharge. This is [ESD](1) sensitive device.

The RF output port is DC decoupled and can sustain up to 25V DC external voltage.

---

[1] http://en.wikipedia.org/wiki/Electrostatic_sensitive_device

RF Explorer Holder

This is a great accessory for the RF Explorer Signal Generator, a high quality stand / holder for the desk while USB cable is connected.

The holder is made of robust laser cut blue acrylic and has provisioned room for a USB cable to connect to a PC.

The USB cable can be connected from behind the holder or any of the two lateral large holes on each side. They're even large enough for bulky USB cables with ferrite beads.

A pre-drilled support bracket at the bottom allows for optionally securing the stand onto a bench for permanent position.

Feature

- Sturdy 3mm acrylic body
- Color: blue and silver
- Secure support for your RF Explorer Signal Generator for working on the bench
- Nice and practical design
- Comes flat-packed, assembly required.
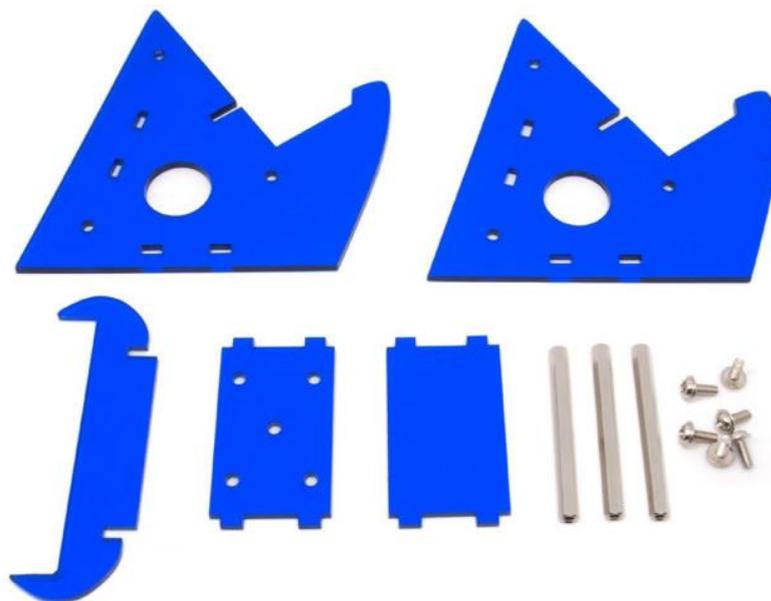

RF Explorer accessories

RF Explorer uses standard SMA quality connectors.

By using adapters you can connect RF Explorer to any RF device or antenna. You can buy SMA adapters and devices on any RF shop, but sometimes is difficult to find what you need and have the certainty the connector you are ordering is the right one. Therefore we have included a selection of quality connectors, adapters and RF devices that are fully compatible with RF Explorer. You can order them from SeeedStudio as well as many of the RF Explorer distributors.

www.rf-explorer.com/buy

SMA-BNC adapter SMA Plug to BNC Jack straight

Usually HAM and two-way handheld radio antennas and devices are designed for BNC connectors. This BNC-female to SMA-male connector will easily interface your RF Explorer to any other BNC antenna or cable.

SMA-N adapter SMA Plug to N Jack straight

Laboratory grade RF bench size instruments use N connector size cables in most cases. This N-female to SMA-male connector will easily interface your RF Explorer to any other bench size instrument or cable.

RF Adapter RP-SMA Jack to SMA Plug straight-long version

Some WiFi antennas and cables are designed for RP-SMA (reverse polarity SMA) and cannot be connected to a standard SMA plug. RP-SMA is a variation of the SMA connector specification which reverses the gender of the interface.

The reason for that was a decision made by FCC in order to prevent end-users from manipulating certified WiFi devices at home, using other available SMA antennas. That led to SMA and RP-SMA devices not being able to connect without an adapter, check Wikipedia for more details[2].

If you want to use some standard WiFi antennas you may need this adapter in order to interface them with RF Explorer. By plugin in this adapter your RF Explorer will be able to connect with any RP-SMA antenna, cable or device.

SMA adapter SMA Plug to SMA Jack right angle

This RF connector is ideal to use RF Explorer deployed horizontally, with any antenna connected onto it.

For instance when you are on the road and you don't have a RF Explorer Stand, you can still easily fit the USB cable, the antenna and connect to a computer with easy.

It is also useful to create a more reliable ground-effect for a dipole antenna if RF Explorer is over a metallic structure such as a car.

---

[2] http://en.wikipedia.org/wiki/RP-SMA#Reverse_polarity_SMA

SMA connection cables

RF cables are an important tool required to directly connect your Spectrum Analyzer to another device (such as a RF transmitter or an antenna) or with a Signal Generator for tracking.

Cables add attenuation to your measurement and, if not correctly connected or if the cable is low quality, it may largely invalidate any measurement. If you use a large cable with known attenuation at a certain frequency, you can compensate that attenuation in the OffsetDB parameter in the CONFIG MENU of the RF Explorer device.

Different cables have different purposes. For frequencies up to 2.4GHz, we recommend flexible RG-316 cables, whereas higher quality and shorter lengths are suggested for frequencies up to 6GHz, where semi rigid RG402 is recommended.

10cm length - SMA male to SMA female 6GHz coaxial cable

This SMA male to female is a quality cable able to handle 6GHz with very low attenuation. It is the perfect cable to connect the RF Explorer Signal Generator to a device, or to work as a tracking generator.

The semi-rigid nature of the cable allows for stable measurement independently of the position and helps on adding mechanical robustness when using RF Explorer Signal Generator with RF Explorer Spectrum Analyzer as Tracking Generator. You will typically need two of these cables to connect the Tracking Generator to a device (with two SMA male connectors) or use an equivalent Male to Male version for a device with different SMA gender connectors.

10cm length - SMA male to SMA male 6GHz coaxial cable

This SMA male to male is a quality cable able to handle 6GHz with very low attenuation. It is the perfect cable to connect the RF Explorer Signal Generator to a device, or to work as a tracking generator.

The semi-rigid nature of the cable allows for stable measurement independently of the position and helps on adding mechanical robustness when using RF Explorer Signal Generator with RF Explorer Spectrum Analyzer as Tracking Generator. You will typically need two of these cables to connect the Tracking Generator to a device (with two SMA female connectors) or use an equivalent Male to Female version for a device with different SMA gender connectors.

50cm length - SMA male to SMA female RF pigtail Coaxial Cable RG316

RF cables are required when connecting RF Explorer to other instruments or devices.

This 50cm cable is good for any frequency up to 3GHz, and can fit RF Explorer with any external SMA-male device or antenna.

If you need extra length for your connection, you can easily daisy chain two or more of these cables in series.

50cm length - SMA male to SMA male plug pigtail cable RG316

RF cables are required when connecting RF Explorer to other instruments or devices.

This 50cm cable is good for any frequency up to 3GHz, and can fit RF Explorer with any external SMA-female device or antenna.

Attenuators

SMA attenuators are used to reduce the input power, and therefore enable RF Explorer Spectrum Analyzer to measure stronger signals. It is also used to protect the input SMA port of RF Explorer when unknown strong signals may be in the environment, so you can use this attenuator on demand. You can easily unplug the attenuator when measurement is for weak signals.

You can also combine multiple attenuators to get additional values. For instance a 10 dB + 30dB attenuators connected in series will give you 40dB total attenuation.

RF Explorer Spectrum Analyzer firmware includes an "Offset DB" feature in the Attenuator Menu, you should specify +0XX dB (where XX is the attenuation value, e.g. 30dB) in this setting when the attenuator is connected in order to get correct readings on screen.

Attenuators recommended by us are high precision mechanical and electrical, working reliably up to 6GHz and supporting continuous input power of up to 2Watt (33dBm). We do not recommend low quality or second hand attenuators as they may alter amplitude readings and, in worse case low quality SMA mechanical connectors, even damage your analyzer RF SMA ports.

Based on total input power you may need to measure, we recommend the following attenuator values to be added to RF Explorer Spectrum Analyzer input port:

Measurable input range	Recommended external attenuator
Lower than -30dBm / 1 micro Watt	No need
-30 to 0dBm / 1 microWatt to 1 milliWatt	30dB
-30 to 10dBm / 1 microWatt to 10 milliWatt	40dB
0 to 33dBm / 1 milliWatt to 2 Watt	60dB

6GHz SMA Attenuator – 60dB

This robust attenuator is custom made, high quality exceptional value 60dB total attenuation. You will not find attenuators of this range anywhere else in the market, the only other option is to daisy chain two 30dB attenuators together.

Therefore, this unit is cost effective option to measure high power RF signals. A 60dB attenuation enables any RF Explorer unit to measure signals of up to 2Watt (33dBm) power without distortion with a single attenuator, as opposed to connecting multiple attenuators in daisy chain.

This precision attenuator can measure up to 6GHz frequency range with high amplitude accuracy. Use OffsetDB: +060 when connected to this attenuator.

6GHz SMA Attenuator - 10dB

This precision attenuator can measure up to 6GHz frequency range with high amplitude accuracy.

Use OffsetDB: +010 when connected to this attenuator.

6GHz SMA Attenuator - 30dB

This precision attenuator can measure up to 6GHz frequency range with high amplitude accuracy.

Use OffsetDB: +030 when connected to this attenuator.

SMA Male/Female Adaptor

All RF connectors wear with use. The RF Explorer SMA ports are subject to minimal wear each time the connector interface is coupled and de-coupled with an antenna, a SMA cable, an attenuator or a RF device of any kind.

 If you repeat plug/unplug operations over the RF Explorer SMA port hundreds of times, the SMA port may underperform over time and exhibit undesired attenuation.

To protect the SMA port for frequent plug/unplug operations, you can use this adaptor and keep it directly attached to the RF Explorer port. Then you plug/unplug other RF devices into this adaptor, not the original SMA port. After hundreds of operations, if the adaptor wear and show attenuation or reliability problems, you can just replace it by a new one and always keep your original RF Explorer SMA port intact.

SMA Termination – 50 ohm dummy load

Using SMA termination or Dummy Load is suggested for protection of the SMA port of your RF Explorer when the device is exposed to unwanted high radiation or strong electronic fields.

For instance, if you carry on your RF Explorer that is exposed to an X-Ray scanner in the airport, you should remove the SMA antenna and plug a protection 50 ohm SMA termination.

SMA termination are also required when using Signal Generator while not connected to an antenna; in this way the generator sees a correct load to avoid damage.

Connecting RF Explorer to a computer

RF Explorer device can be connected to a computer (Windows, Linux, Mac and Android) for additional capabilities, including higher resolution screen, additional features and programmability.

For free, open source RF Explorer for Windows tool, please check this link: www.rf-explorer.com/windows

For additional software options developed by a growing list of 3rd party companies, please check this link: www.rf-explorer.com/software

API programming specification for RF Explorer

RF Explorer offers a compact, easy to use, USB / RS232 programming interface. It can be used to automate external solutions when connected to an external computer or device.

For full specification of the current API, check www.rf-explorer.com/API .

There are .NET and Python libraries available in GITHUB repository, ideal for custom work required by your application.

RF Explorer for Windows open source code

RF Explorer is a hacker friendly device. Full open source under LPGL license is offered to the community.

As hackers ourselves, we do like customizing, tinkering and expanding gadgets. We certainly designed and built RF Explorer with these factors in mind.

We love and make good use all community contributions, contact us or send us a PULL request if you have source code contributions you want integrated in the final product.

Check our hacker corner link for more details.

Specifications

For a complete list of features and RF Explorer Signal Generator models, expansion boards available, and accessories please check the RF Explorer Model Map online.

Acknowledgments

This product could not be possible without the SeeedStudio Team who manufacture, test and distribute RF Explorer worldwide.

RF Explorer is a reality thanks to the great community behind, always suggesting features and providing useful feedback.

FCC and CE regulations

RF Explorer is a Test and Measurement device, and therefore compatible with US FCC regulation 47 CFR Part 15.103(c).

RF Explorer is certified for CE compliance under regulations EN/IEC61236 and EN/IEC61000.

License

RF Explorer embedded firmware is copyrighted © by Ariel Rocholl, 2010-2017

RF Explorer for Windows is Open Source software released under GPL v3, so you are free to modify, distribute and use it based on GPL terms.

RF Explorer is a registered trademark in USA, Australia, China, Japan, Canada and all EU Countries.
