Chapter 1: Software and Software Engineering

1.1 The Nature of Software...

Software is intangible

Hard to understand development effort

Software is easy to reproduce

Cost is in its *development*

—in other engineering products, manufacturing is the costly stage

The industry is labor-intensive

Hard to automate

2

The Nature of Software ...

Untrained people can hack something together

Quality problems are hard to notice

Software is easy to modify

People make changes without fully understanding it

Software does not 'wear out'

It deteriorates by having its design changed:

—erroneously, or

—in ways that were not anticipated, thus making it complex

3

The Nature of Software

Conclusions

Much software has poor design and is getting worse

Demand for software is high and rising

We are in a perpetual 'software crisis'

We have to learn to 'engineer' software

4

Types of Software...

Custom

For a specific customer

Generic

Sold on open market

Often called

—COTS (Commercial Off The Shelf)

—Shrink-wrapped

Embedded

Built into hardware

Hard to change

Types of Software

Differences among custom, generic and embedded software

	Custom	Generic	Embedded
Number of <i>copies</i> in use	low	medium	high
Total <i>processing power</i> devoted to running this type of software	low	high	medium
Worldwide annual <i>development effort</i>	high	medium	low

6

Types of Software

Real time software

E.g. control and monitoring systems

Must react immediately

Safety often a concern

Data processing software

Used to run businesses

Accuracy and security of data are key

Some software has both aspects

1.2 What is Software Engineering?...

The process of solving customers' problems by the systematic development and evolution of large, high-quality software systems within cost, time and other constraints

Solving customers' problems

This is the goal of software engineering

Sometimes the solution is to buy, not build

Adding unnecessary features does not help solve the problem

Software engineers must communicate effectively to identify and understand the problem

8

What is Software Engineering?...

Systematic development and evolution

An engineering process involves applying well understood techniques in a organized and disciplined way

Many well-accepted practices have been formally standardized

—e.g. by the IEEE or ISO

Most development work is *evolution*

Large, high quality software systems

Software engineering techniques are needed because large systems cannot be completely understood by one person

Teamwork and co-ordination are required

Key challenge: Dividing up the work and ensuring that the parts of the system work properly together

The end-product that is produced must be of sufficient quality

9

What is Software Engineering?

Cost, time and other constraints

Finite resources

The benefit must outweigh the cost

Others are competing to do the job cheaper and faster

Inaccurate estimates of cost and time have caused many project failures

1.3 Software Engineering and the Engineering Profession

The term Software Engineering was coined in 1968

People began to realize that the principles of engineering should be applied to software development

Engineering is a licensed profession

In order to protect the public

Engineers design artifacts following well accepted practices which involve the application of science, mathematics and economics

Ethical practice is also a key tenet of the profession

1.4 Stakeholders in Software Engineering

1. Users

Those who use the software

2. Customers

Those who pay for the software

3. Software developers

4. Development Managers

All four roles can be fulfilled by the same person

12

1.5 Software Quality...

Usability

Users can learn it and fast and get their job done easily

Efficiency

It doesn't waste resources such as CPU time and memory

Reliability

It does what it is required to do without failing

Maintainability

It can be easily changed

Reusability

Its parts can be used in other projects, so reprogramming is not needed

www.lloseng.com

Software Quality...

Customer:
solves problems at
an acceptable cost in
terms of money paid and
resources used

User:
easy to learn;
efficient to use;
helps get work done

QUALITY
SOFTWARE

Developer:
easy to design;
easy to maintain;
easy to reuse its parts

Development manager:
sells more and
pleases customers
while costing less
to develop and maintain

Software Quality

The different qualities can conflict

Increasing efficiency can reduce maintainability or reusability

Increasing usability can reduce efficiency

Setting objectives for quality is a key engineering activity

You then design to meet the objectives

Avoids 'over-engineering' which wastes money

Optimizing is also sometimes necessary

E.g. obtain the highest possible reliability using a fixed budget

www.lloseng.com

Internal Quality Criteria

These:

Characterize aspects of the design of the software

Have an effect on the external quality attributes

E.g.

—The amount of commenting of the code

—The complexity of the code

Short Term Vs. Long Term Quality

Short term:

- Does the software meet the customer's immediate needs?
- Is it sufficiently efficient for the volume of data we have today?

Long term:

- Maintainability
- Customer's future needs

1.6 Software Engineering Projects

Most projects are evolutionary or maintenance projects, involving work on *legacy* systems

Corrective projects: fixing defects

Adaptive projects: changing the system in response to changes in

- Operating system
- Database
- Rules and regulations

Enhancement projects: adding new features for users

Reengineering or perfective projects: changing the system internally so it is more maintainable

Software Engineering Projects

'Green field' projects

New development

The minority of projects

Software Engineering Projects

Projects that involve building on a *framework* or a set of existing components.

The framework is an application that is missing some important details.

- E.g. Specific rules of this organization.

Such projects:

- Involve plugging together *components* that are:
 - Already developed.
 - Provide significant functionality.
- Benefit from reusing reliable software.
- Provide much of the same freedom to innovate found in green field development.

1.7 Activities Common to Software Projects...

Requirements and specification

Includes

- Domain analysis
- Defining the problem
- Requirements gathering
 - Obtaining input from as many sources as possible
- Requirements analysis
 - Organizing the information
- Requirements specification
 - Writing detailed instructions about how the software should behave
