

# Modulation Process

- Modulation: transforming an information-carrying signal  $m(t)$  (lowpass) into a narrowband signal  $x(t)$ .  $m(t)$  is also called the modulating signal or message.
- Start with a sinusoidal signal (carrier)  $x(t) = A \cos(2\pi ft + \varphi_0)$
- Varying  $A = A(t)$  according to  $m(t)$  – amplitude modulation (AM)
- Varying  $\varphi = \varphi(t)$  according to  $m(t)$  – phase modulation (PM)
- Varying  $f = f(t)$  according to  $m(t)$  – frequency modulation (FM)
- FM and PM can be viewed as angle modulation.
- General form of a modulated signal:

$$x(t) = A(t) \cos \left( \omega_c t + \int_0^t \Delta\omega(\tau) d\tau + \varphi(t) \right)$$

# Amplitude Modulation (AM)

- Information-bearing signal  $m(t)$  is impressed onto the carrier amplitude.
- Four types of AM:
  - conventional,
  - double sideband suppressed carrier (DSB-SC)
  - single sideband (SSB); can be lower or upper (LSB/USB)
  - vestigial sideband (VSB)
- Spectral characteristics & bandwidth
- Modulation index
- Power efficiency

# Conventional AM

- General form: 
$$x(t) = \underbrace{A_c [1 + m(t)]}_{A(t)} \cos(2\pi f_c t + \phi_c)$$

- $m(t)$  must be constrained:  $-1 \leq m(t)$

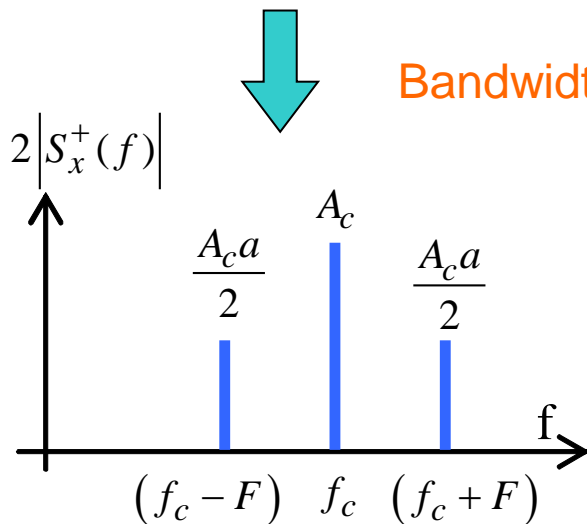

- $A_c$  – carrier amplitude without modulation;
- $A_c [1 + m(t)]$  - time-varying (modulated) carrier amplitude.

- Example: sinusoidal modulating signal:  
 $m(t) = a \cos(\Omega t)$

# Conventional AM: Sinusoidal Modulation

- Modulated signal:  $x(t) = A_c [1 + a \cos(2\pi Ft)] \cos(2\pi f_c t + \phi_c)$
- Minimum & maximum carrier amplitudes:  $A_{\min} = A_c [1 - a]$   
 $A_{\max} = A_c [1 + a]$
- Modulation index:  $M = \frac{A_{\max} - A_{\min}}{2A_c} \leq 1$
- % mod. =  $M * 100\%$
- x(t) spectrum:  $x(t) = A_c \cos[2\pi f_c t + \phi_c] + \frac{A_c a}{2} \cos[2\pi(f_c - F)t + \phi_c] + \frac{A_c a}{2} \cos[2\pi(f_c + F)t + \phi_c]$

Geometrical representation

# Conventional AM: Sinusoidal Modulation

- Signal power (average):

$$P_x = \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^T x^2(t) dt = \overline{x^2(t)} = \frac{A_c^2}{2} + \frac{a^2 A_c^2}{4}$$

carrier      sidebands

- Power efficiency:

$$\eta = \frac{P_{SB}}{P_{tot}} = \frac{a^2}{2 + a^2}$$

- Bandwidth:  $\Delta f = 2F$

- Peak power:  $P_{peak} = \frac{[A_c(1+a)]^2}{2}$

- In general: (no DC in  $m(t)$ )  $\eta = \frac{P_m}{1 + P_m}$

Power efficiency of AM

- What is the best power efficiency?

# Conventional AM: General Case

- General form:  $x(t) = A_c [1 + m(t)] \cos(2\pi f_c t + \phi_c)$
- Modulated signal spectrum:

$$S_x(f) = \frac{A_c}{2} \left[ \delta(f - f_c) e^{j\phi_c} + \delta(f + f_c) e^{-j\phi_c} + S_m(f - f_c) e^{j\phi_c} + S_m(f + f_c) e^{-j\phi_c} \right]$$

$$2|S_x^+(f)| = A_c \left[ \delta(f - f_c) + |S_m(f - f_c)| \right]$$

- Power ?
- Power efficiency?

- Measured by spectrum analyzer: no inf. height for delta function in practice,  $\delta(f - f_c) \leftrightarrow \Delta(f - f_c)$

Bandwidth???

# Example

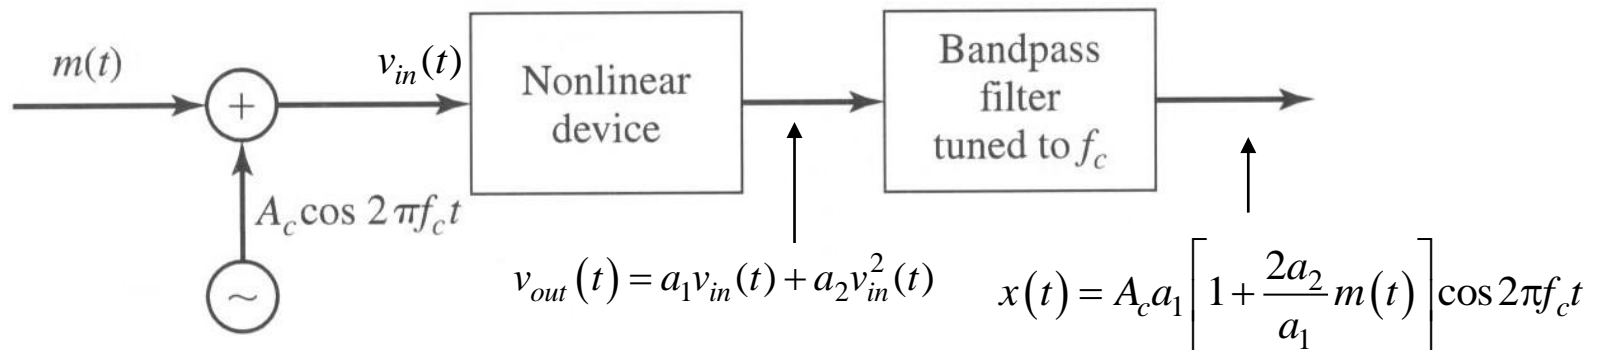

- Conventional AM signal with a sinusoidal message has the following parameters:

$$A_c = 10, M = 0.5, f_c = 1\text{MHz}, F = 1\text{kHz}$$

1. Find time-domain expression  $x(t)$  of the signal
2. Find its Fourier transform
3. Sketch its spectrum as it appears on the spectrum analyzer
4. Find the signal power, peak power and the power efficiency
5. Find the signal bandwidth

# Generation of Conventional AM

- Power-law modulator:

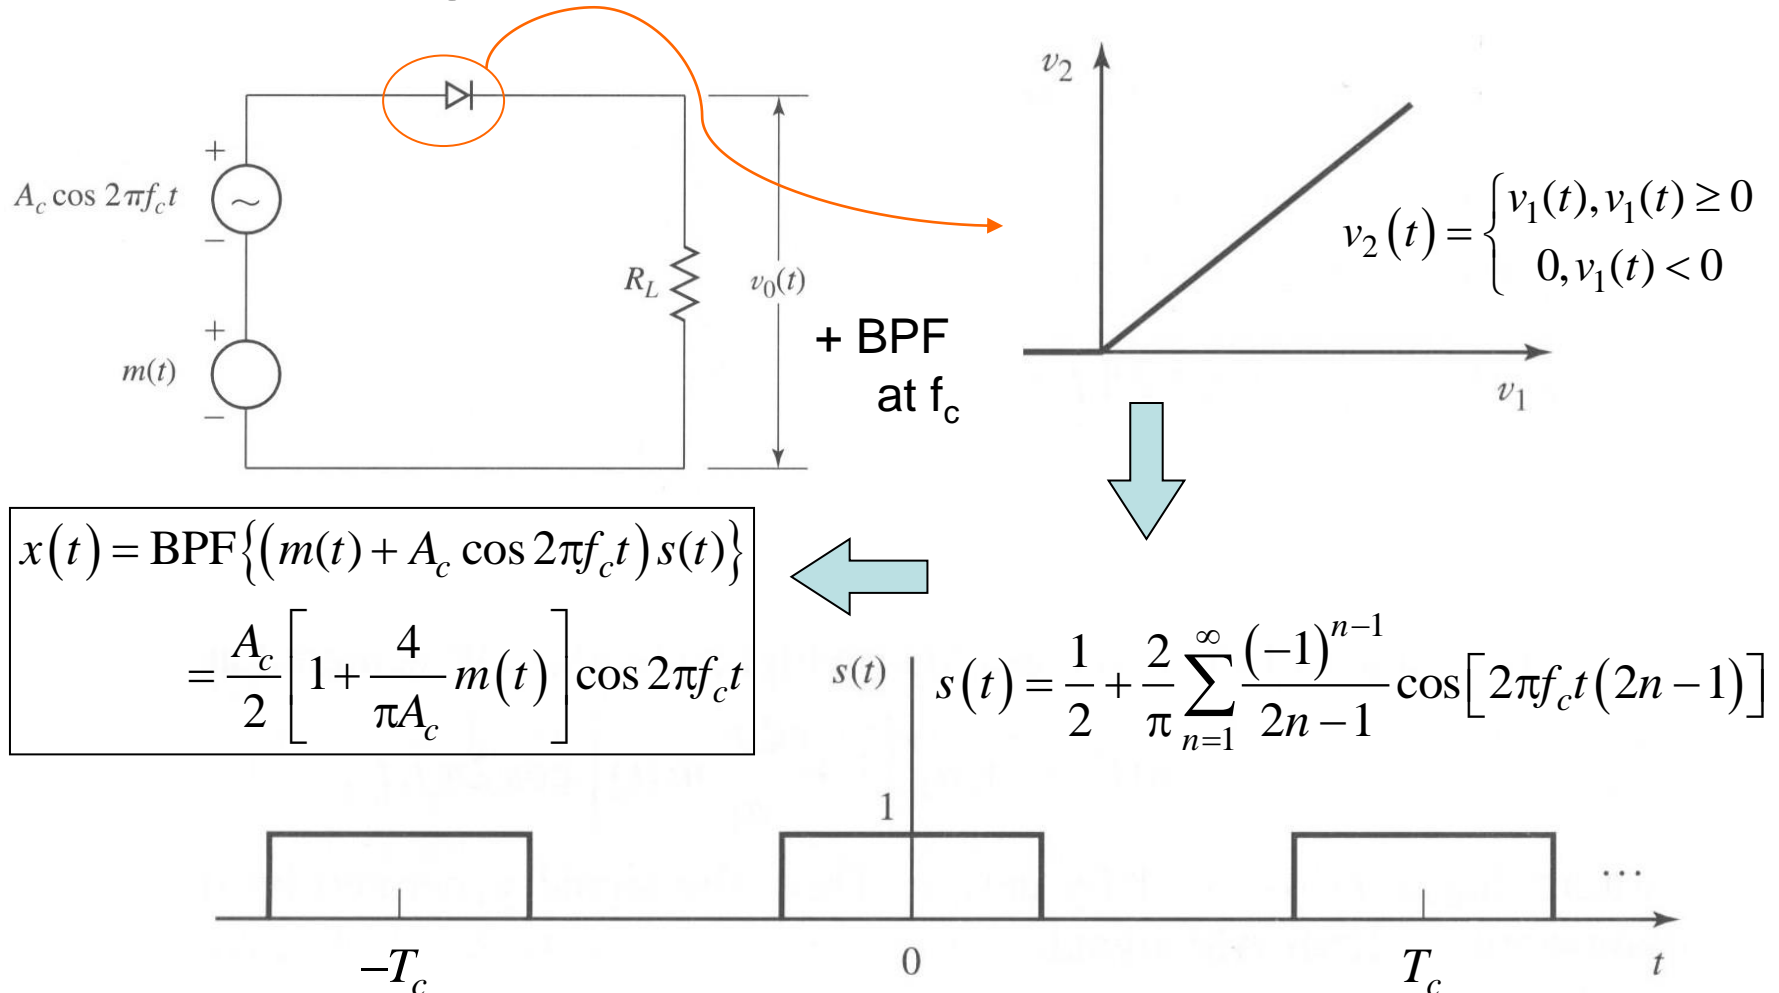

- Using variable-gain amplifier (modulator):

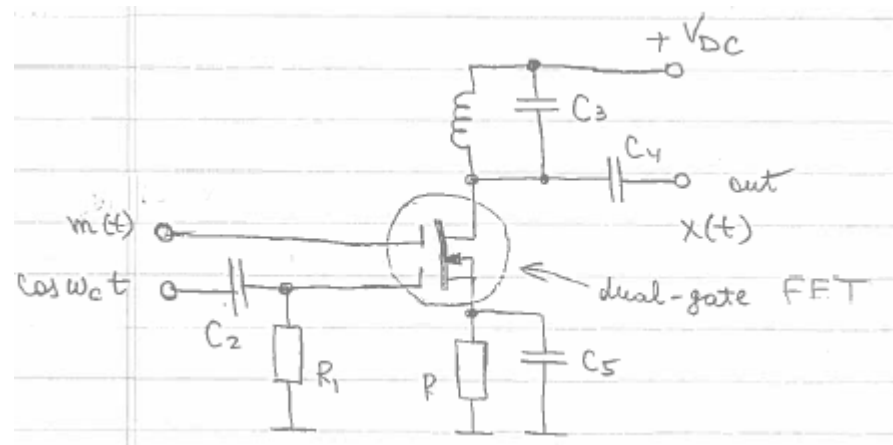

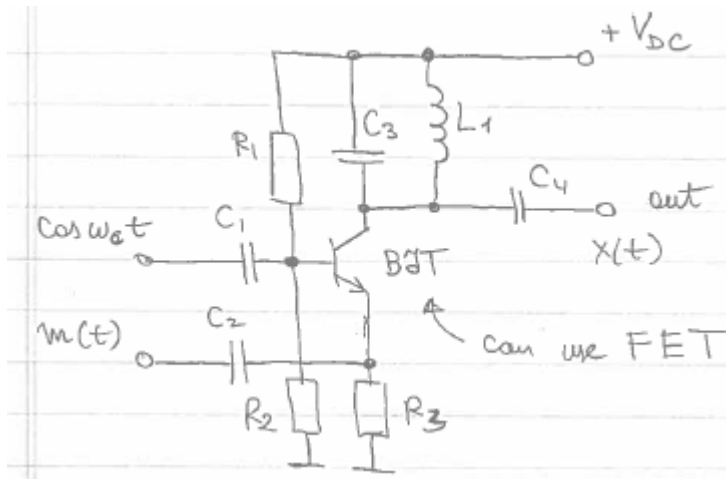

# Generation of Conventional AM

## ■ Switching modulator:

# Examples of Modulators for Conventional AM

For more info, see e.g.

- B. Razavi, RF Microelectronics, Prentice Hall, 2012.
- U.L. Rohde, D.P. Newkirk, RF/Microwave Circuit Design for Wireless Applications, Wiley, 2000.
- B. Leung, VLSI for Wireless Communications, Prentice Hall, 2002.

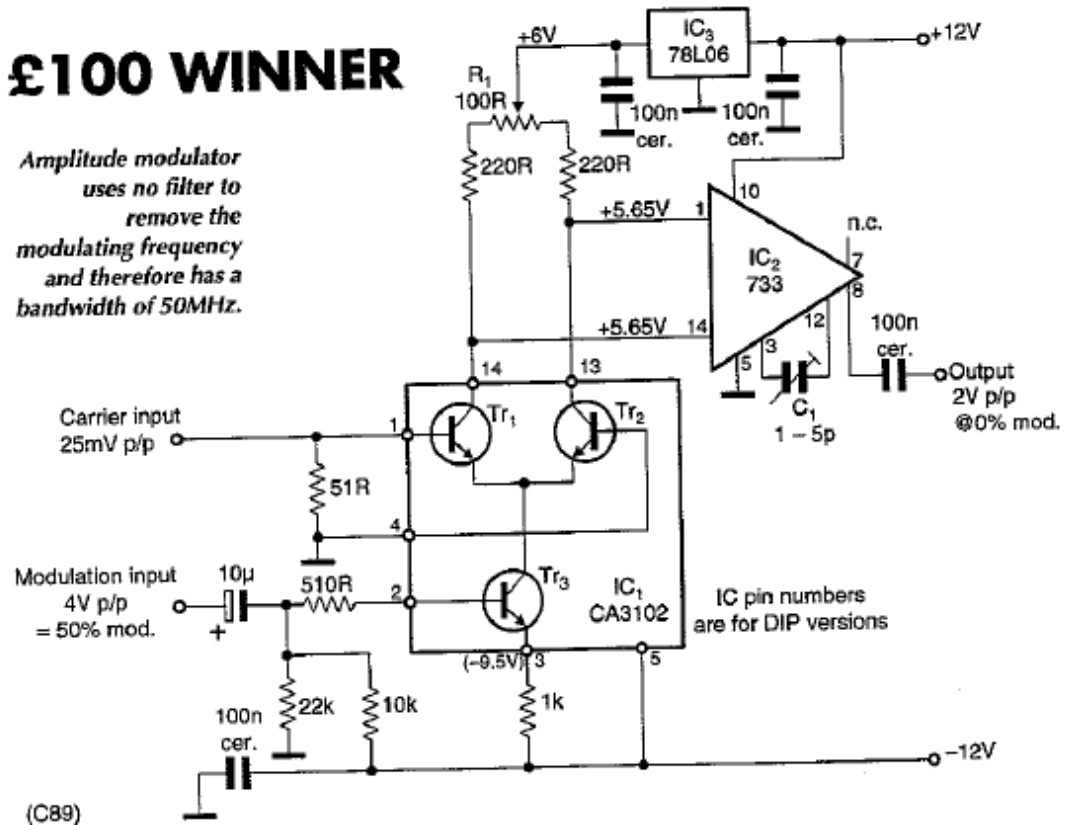

# Examples of Modulators for Conventional AM

adopted from Electronics World, July 1998.

## £100 WINNER

*Amplitude modulator uses no filter to remove the modulating frequency and therefore has a bandwidth of 50MHz.*

# Demodulation of Conventional AM

- Envelope detector
- RC – lowpass filter
- Attenuates carrier, passes modulating signal

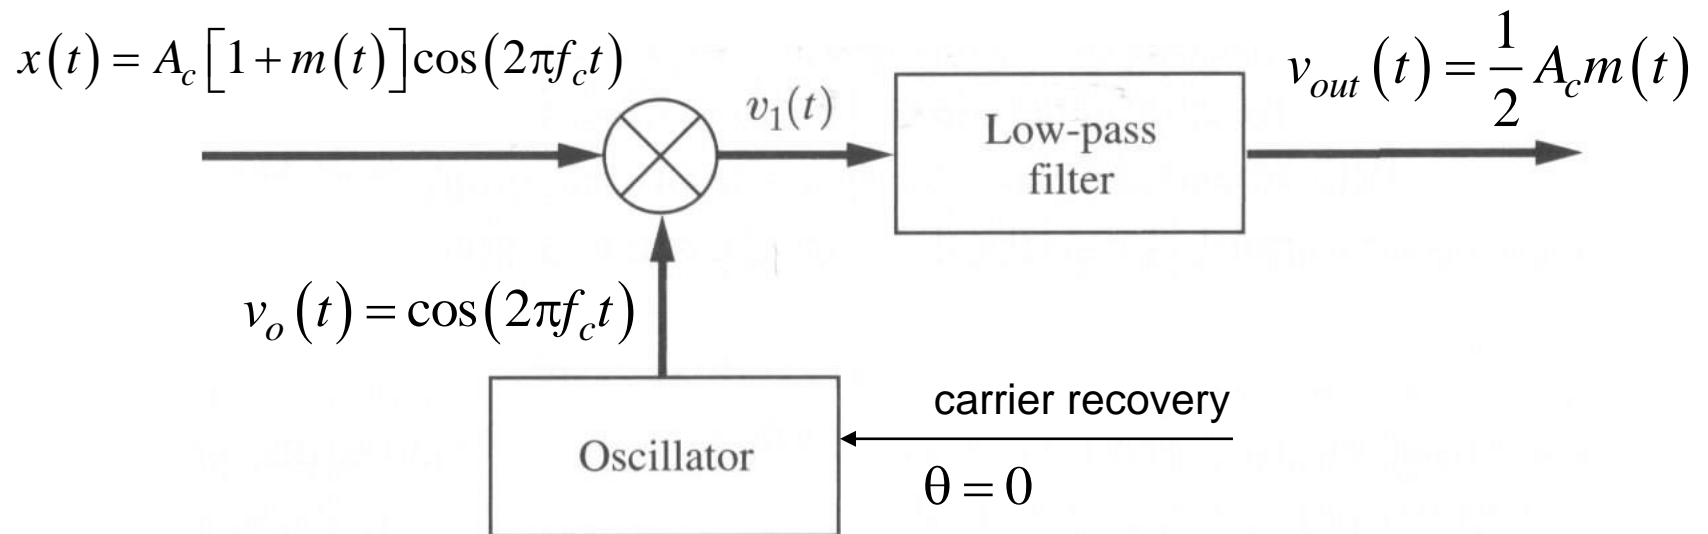

$$\Delta f \ll \frac{1}{2\pi RC} \ll f_c$$

$$T_c \ll \tau = RC \ll T_m$$

# Demodulation of Conventional AM

- Product detector:

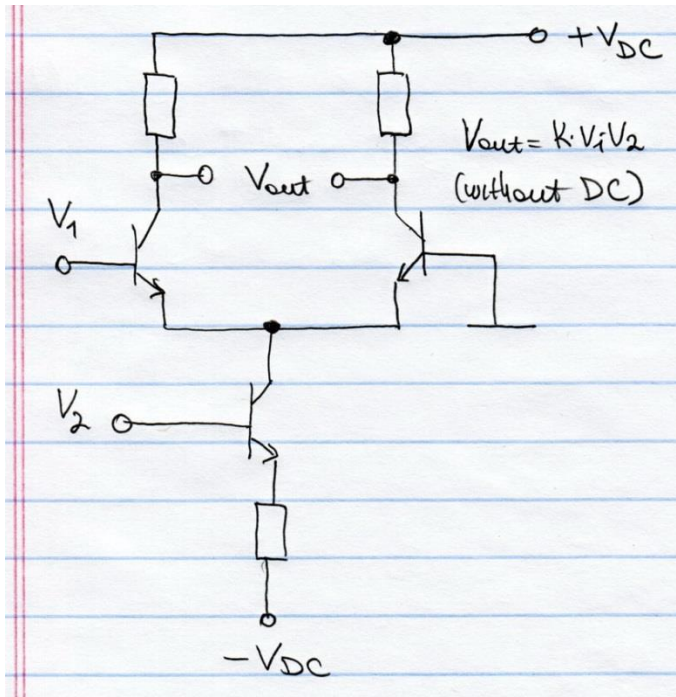

- What happens if  $\theta \neq 0$  ?

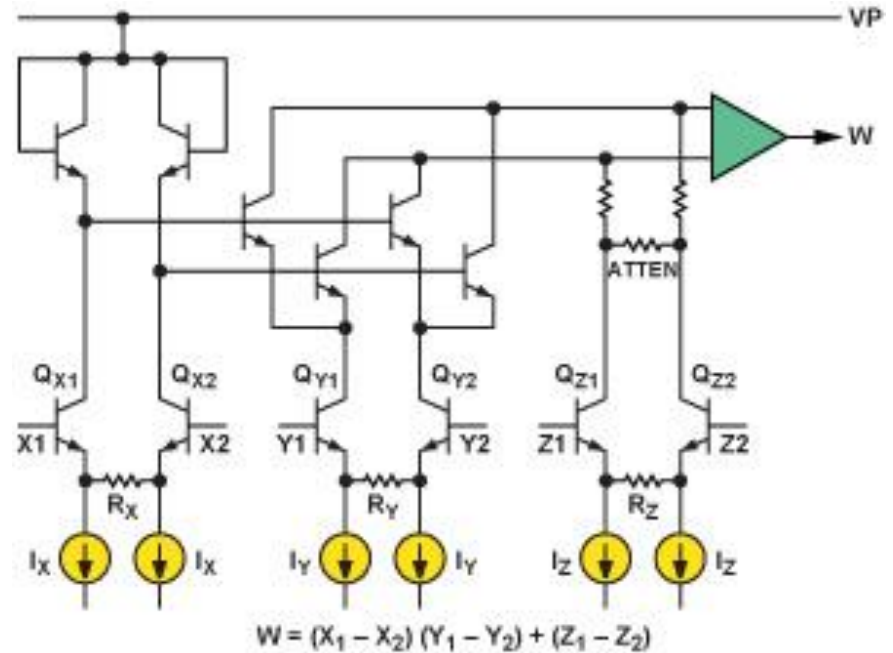

# Multiplier Implementation

more realistic

simplified

AD534: A Four-Quadrant Translinear Multiplier

Adopted from "Considering Multipliers" by B. Gilbert

# Advantages/Disadvantages of Conventional AM

- Advantages
  - Very simple demodulation (envelope detector)
  - “Linear” modulation\*
- Disadvantages
  - Low power efficiency
  - Doubles the baseband bandwidth

\*Q.: is the conventional AM modulator an LTI system?

# Double-Sided AM: Suppressed Carrier (DSB-SC)

- How to increase power efficiency?

- DSB-SC signal:  $x(t) = A_c m(t) \cos(2\pi f_c t)$

- Example: sinusoidal modulation,

$$x(t) = A_c a \cos(2\pi Ft) \cos(2\pi f_c t)$$

- Spectrum:  $x(t) = \frac{aA_c}{2} [\cos(2\pi(f_c - F)t) + \cos(2\pi(f_c + F)t)]$

Bandwidth???

Geometrical representation???

Power efficiency???

Modulation index???

# DSB-SC: General Case

- DSB-SC signal:  $x(t) = A_c m(t) \cos(2\pi f_c t)$
- Spectrum:  $S_x(f) = \frac{A_c}{2} [S_m(f - f_c) + S_m(f + f_c)]$
- What do you see on a spectrum analyzer?
- Bandwidth ? Power efficiency? PSD?

# Generation of DSB-SC

- Generation:
  - Multiplier
  - Switch (digital)
- Balanced modulator:

Q: what if misbalanced?

J.Proakis, M.Salehi, Communications Systems Engineering, Prentice Hall, 2002

# Generation of DSB-SC

## Ring modulator

$$v_{out}(t) = \text{BPF}\{m(t)s(t)\}$$

$$= \frac{2A_c}{\pi} m(t) \cos 2\pi f_c t$$

$$s(t) = A_c \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{2n-1} \cos[2\pi f_c t (2n-1)]$$

- Large-amplitude sinusoidal signal may be used instead of the square wave

# Demodulation of DSB-SC

- Why will the envelope detector not work?

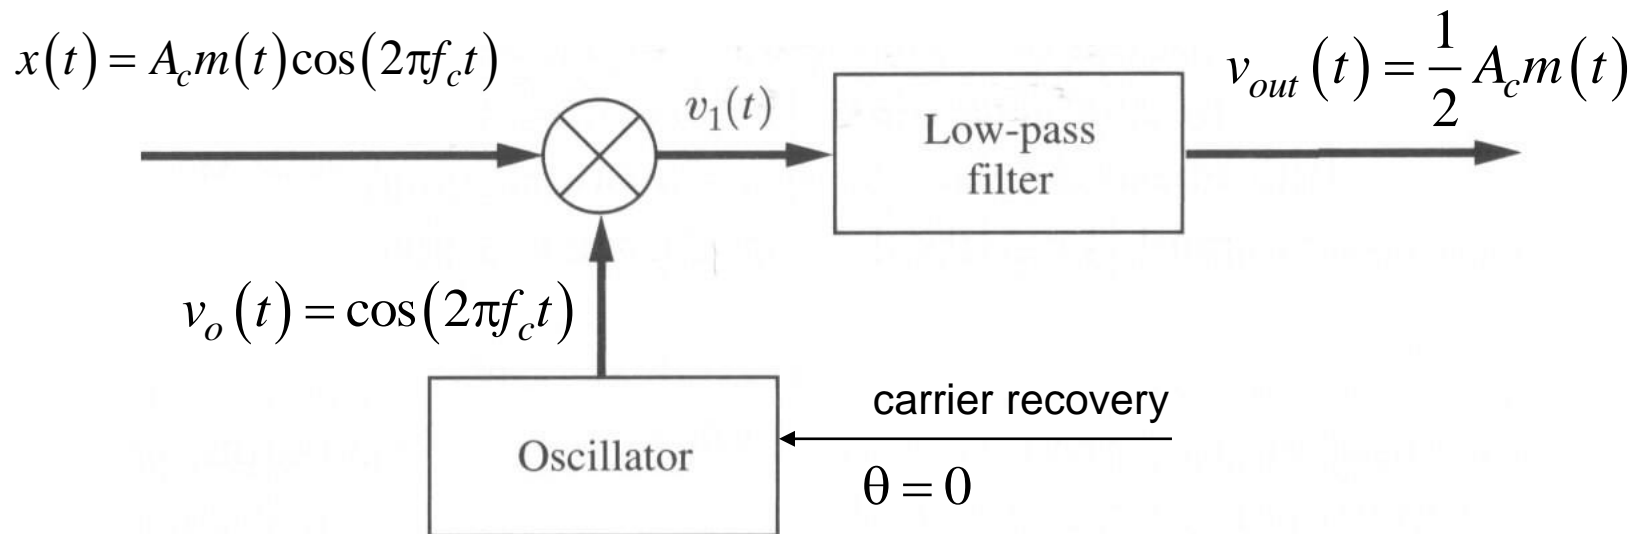

$$x_{in}(t) = m(t) \cos(2\pi f_c t)$$

$$x_{out}(t) = ?$$

# Demodulation of DSB-SC

- Product detector:

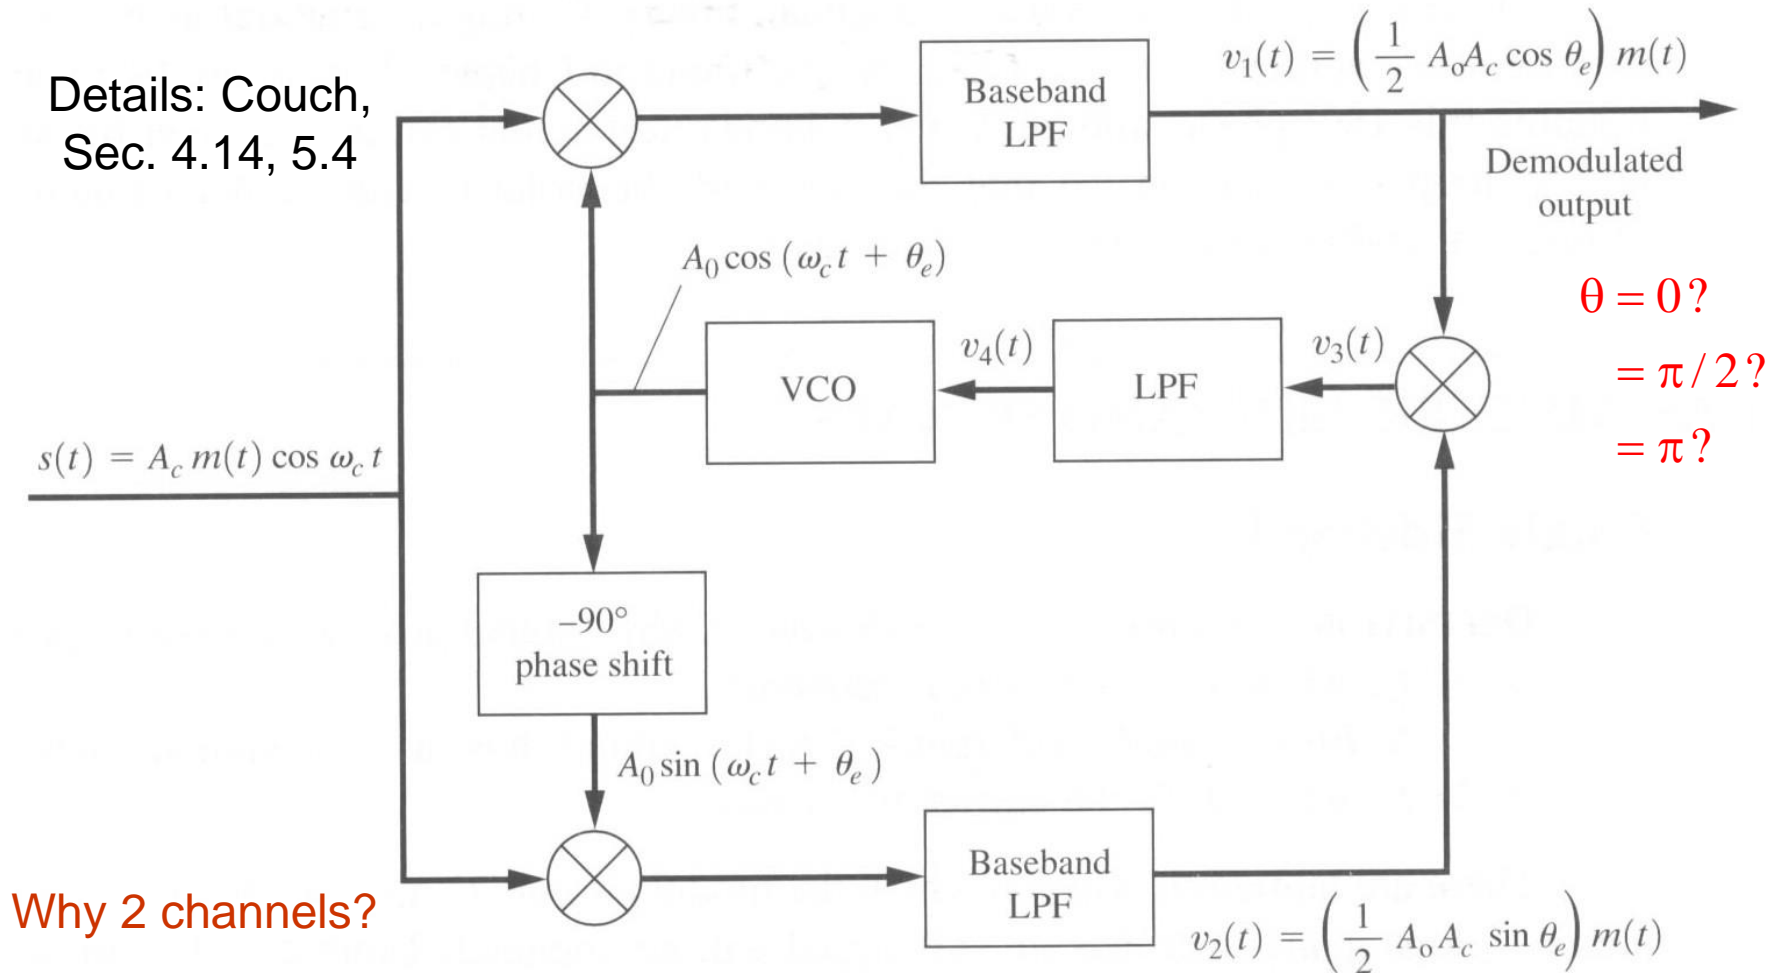

- What happens if  $\theta \neq 0$  ?

# Demodulation of DSB-SC

## Demodulation - Costas loop:

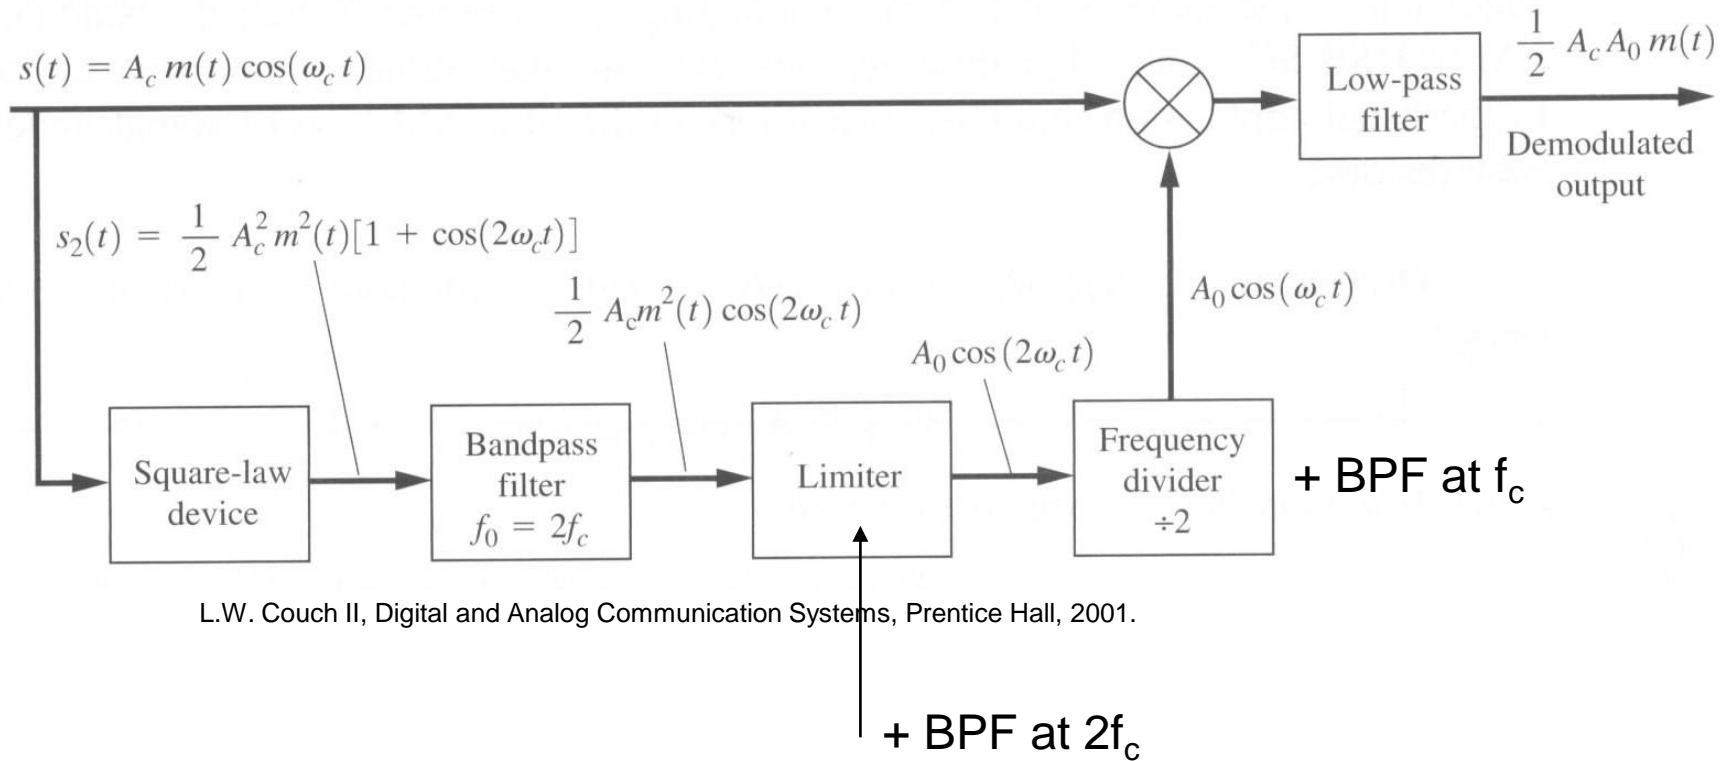

Details: Couch,  
Sec. 4.14, 5.4

L.W. Couch II, Digital and Analog Communication Systems, Prentice Hall, 2001.

# Demodulation of DSB-SC

- Product detector + squaring carrier recovery loop:

# Advantages/Disadvantages of DSB-SC

- Advantages
  - High power efficiency
  - If message  $m(t) > 0$ , envelope detection is possible
- Disadvantages
  - Doubles the baseband bandwidth
  - More complex modulation/demodulation (some form of carrier recovery is required)
  - Pilot tone may be required to simplify demodulation

# Summary of Disadvantages of AM

- Low power efficiency (of conv. AM)
  - solved via DSB-SC
- Low noise immunity
  - via FM or digital
- Low spectral efficiency (double bandwidth)
  - ???

# Summary

- Modulation process. Types of analog modulation.
- Conventional AM. Time-domain & frequency-domain representations. Power efficiency & bandwidth.
- Generation (modulation) & demodulation of conv. AM.
- Double sideband suppressed carrier (DSB-SC). Spectrum. Bandwidth. Generation & demodulation of DSB-SC.
- Advantages/disadvantages of conventional & DSB-SC AM.
- **Homework**: Reading: Couch, 5.1-5.4, 4.4., 4.11-4.13. Study carefully all the examples, make sure you understand them and can solve them with the book closed.
- Do some end-of-chapter problems. Students' solution manual provides solutions for many of them.
